>
> While on this topic. I have a question for those of you who live in the
> Washington DC area. Have any of you ever picked up Dana Scully on her
> cordless phone? Or even better yet her and Moulder discussing a case on.

I heard them last year(I have a cordless/cellular waiver from the League of Nations) she was trying to rent an arc welding unit when her call waiting kicked in,Moulder was on the other line and had info about an "ET"landing inside the beltway. They were real stupid cause they gave the location on an unsecured line. So I took my TV camera to the location and waited in the back of my unmarked newstruck(with blackout windows).
I waited....and waited...and waited. About three hour passed when I saw this very bright white light flash. When my eyes finally adjusted and I was able to focus my camera on the activity before me....It was Scully,Moulder and Marion Barry eating Chinese food on the hood of their cars with a couple guys that looked like welders.
When I got back to the TV station and played back the tape...they were not there!

Really wierd!

Lesson Learned:
Welders *ARE* Extra Terrestrials.

>anybody out there that knows otherwise?

I did mine pretty easily. There are a couple of different mods depending on the date code of your unit. That's indicated by the small 3 character silver sticker on the back.

I no longer have the file, so don't bother asking. But I found it pretty easily on some scanner-oriented ftp site. I don't remember the location of that, but I seem to remember that back when I was trying to find out, it was pretty easy to locate.

Sorry I'm not more helpful, but I thought I'd let you know that it is possible and it's pretty easy.

Good luck.

3011. WTD: AR-3000

From: herb@alpha1.csd.uwm.edu
Message-ID: <4f486s$65i@uwm.edu>
Source record: 240557

I would be willing to trade too absolutely cool radios for one absolutely cool radio. I have A PRO-2006, everyone's favorite scanner. I also have a Sony SW-100s cute little shortwave radio. The SW recieves with SSB, or Synchronous detection, which I have concluded to be an absolute necessity for listening to SW brodcasts.

The 2006 has been 'relieved' of an annoying blockage in the 800mhz band. otherwise, it has not been altered. They are both in mint shape, with boxes, manuals, antennas, and other neat stuff that comes with them. Oh yeah, The Pro 2006 is the one with the deeeeeeelightful indiglow backlight.

(spelled indiglow wrong to avoud prosecution by timex)
(spelled avoid wrong because i was not thinking.)

I am looking for an AOR-3000a with full coverage, because I need a radio with SSB... I would like for it to be in good shape.

I would also trade the 2006 directly for an AR-2500.

Any questions can be mailed to me @ herb@csd.uwm.edu

It's very unlikely that your approach will be sucessful, as most modern
scanner CPU's have the "PROM" built in to it.
Some ways around this might be:
1.add a different CPU(prehaps something like a "basic stamp")to the scanner.
2.using a suitable device, try to put "forbidden frequencies" directly
into the scanner's RAM(this won't work on the units that have the RAM
built into the CPU.

I use toothpaste on a Q-tip for minor scratches and smudges.
There should be just enough grit to allow some polishing action.
Don't use too much pressure though or the plastic can
over- heat and it'll end up worse than when you started.

Hi,

Can anyone out there provide me with any technical data regarding an ACARS decoder?? Basically, I'm trying to build my own rather than fork out a fortune for a commercially available one.

I need details of the design of the electronics and the decoding software.

All help greatly appreciated.

Thanks in advance,

Al.

Look for 'celltracker' that connects to a Motorola car/bag phone.
If someone points me to info on how the 2006 controls the PLL, or
how a Motorola handset 3-wire bus works, I'll modify the code I
have to control either unit.

There is no advantage to buying a scanner at Radio Shack if your want, say an AOR8000. If you want a PRO2042, they're unfortunately the only game in town. What you're really asking is what scanner should I buy? Answer that question first and then start finding a model that fits that need. You want a portable to take to the races? You want a zillion channels to monitor fire, police etc. in 10 towns?

I don't know if we are talking about the same mount, but I have used a RS magmount scanner antenna on my van driving the interstate at slightly over the posted speed limit of 70 mph and western Oklahoma almost always has wind. It did not come loose and I have no way of knowing what its endurance might be. I was wondering how you have it placed. Is it on a very flat surface and is there any material in between the antenna and the mount, such as a vinyl top? Also, where on the car do you have it placed? Finally, I guess it's possible that the magnet is substandard. You might try comparing it to another one to see if that is the problem.

Regards and luck with your problem.

dito on the cluleless radio shack staff (in the US). You would think
they would make an effort to get technically adept staff...

Not all radio shack staff are cluleless, but no one can argue that the
vast majority of them have no knoweledge of electronics at all.

Odd for a store that sells capacitors, resistors, etc...

Mistie Mullarkey (cv282@FreeNet.Carleton.CA) wrote:
: The following is an exerpt from the Canadian RS Catalog:

: "...Radio Shack has many things to be proud of-our 800 retail locations
: from coast to coast; our 2000 electronics experts who provide outstanding
: product knowledge and customer care in our stores;... Our knowledgeable,
: experienced staff can simplify technology, and answer thousands of
: questions about how products work. That's why we say, 'You've got
: questions. We've got answers.'"

: Personally I think they should change the slogan to:"
: "You've got questions. Get our catalog"

: When I read such a thing in their catalog, I expect them to actually know
: about their products. Like I have written before, when I brought a
: defective cordless phone back, the manager was surprised to see that he
: had a Call Display cordless phone in his store. Then it took him 25
: minutes looking in the manual to see how it worked. Meanwhile he's telling
: me about all the features of the phone. Duh! I already know about the
: features that's why I bought it, just give me a new one!

: Don't tell me that Radio Shack is supposed to be self serve when they
: boast about their knowledgeable staff. The only thing RS staff know how to
: do is change batteries.

Ease up guys. I can relate to both of these viewpoints. I will probably be getting a no-code license this year, but there are many old-timers in my area who feel that no-code should mean no license. I can't agree with them. Morse code was developed to overcome the technical limitations imposed by early telegraph lines and was useful in radio as well. But now that we have the ability to do voice reliably, it's usefulness is limited. Ironically, there is still a place for such a code -- those who have lost their ability to speak would find morse useful -- but I have not seen anyone address this issue. Surely we don't want to cut someone off the hobby simply because they can't talk.

Was Tandy "legally" ringht? Absolutely, based on the contract. Did they most likely lose a customer over $0.50? Absolutely. I suspect a call to a supervisor would remove the $15.00 charge as a "good faith" move by Tandy. The response by the Tandy rep, if as reported, seems a bit on the harsh side.

I had them scratching their heads when I asked for a frequency counter...

From: verbrugg@pilot.msu.edu
Message-ID: <4f5tgd$1713@msunews.cl.msu.edu>
Source record: 240591

PLEASE give me some advice. I am posting this again in case the first one did not make it...

I REALLY want to get a scanner. I do not have a lot of money, but do not want to buy a piece of junk. I am willing to spend up to $150 but would like to spend less than $100. I am looking at a Uniden BearCat 350A at $80. Is this a "good" unit? Anyone selling something better for my price range?

Also, I want to get a shortwave radio with continous band coverage (as opposed to shortwave #1-9). Is there a unit which performs as both a scanner and shortwave receiver?

Any help would be greatly appreciated!!!

I'm taking a business trip to Phoenix on the 2-9-96 and I'm looking for some freqs. Specifically, I'm looking for fire and police main dispatch freqs within the city limits. Also any freqs that pertain to on scene action like a fireground channel, etc. Any other freqs would help too. You can post in this newsgroup or e-mail me at dawg9@skypoint.com on or before 2-9-96. Your help is greatly appreciated.

3050. RS discone problems

Newsgroup: rec.radio.scanner
Date: 1996-02-05 00:00:00 UTC
From: patrick.walkup@travel.com
Message-ID: <1d.25399.930@travel.com>
Source record: 240596

Hi Jim
Just got a RS discone for christmas. I've read the reviews about discones being short on gain, but I don't need gain, I need wideband reception on my 2006. Also the fact that North Central Alarm is a few blocks away gives me a serious potential for overload. I've found that the signal coming into my scanner desenses it so much that I must switch in the 10x attenuator most of the time. 800 mhz reception is the exception, there I turn the attenuator off. 217 mhz Watercom reception is excellent, and the GMRS and itinerant frequencies are full of signals. Finally, I don't have to lockout "good' frequencies because of computer noise anymore. It's a good antenna, try replacing that rg59 with rg6, and if you have problems soldering your connectors, try ordering a set of preassembled connectors for your setup..
By the way, speaking of the RS discone, has anyone popped the "boot' off the top to see if a whip can be added for 30-50 mhz reception?
Pat

I wouldn't be so quick to boast about battery changing if I were you. I recently (last Friday) parted ways with RS. For years now I have worked the Christmas season at RS. When I am there, I am considered to be the 'technoid' on duty. When one of the other guys gets a tough question (about tech stuff, not knobology) they usually point in my direction and say "See that guy with his sleeves rolled up.....".

However, despite my experience in electronics, there is one aspect of RS that I have never mastered. I can never get all eight penlite batteries to stay in those darned RC cars while I try to get the cover on! o<:-]

I use Mequiars #17 Mirror Glaze (Clear Plastic Cleaner) on CD's, motorcycle visors, and have used it on LCD windows with great success. A word of warning however...Use a small amount at a time. I use a Q-tip for an applicator, and an old T-shirt to buff it out. I buy mine at NAPA parts stores (Auto Parts). It will not remove a deep cut or scratch. I also use it on plexglass windows. It also meets Military Spec P-P 560B, what ever that is.

And when you go to use that coupon, they decrease the price of the item
being purchased by $3 on the sales slip _before_ taxes are computed; which
means that any sales tax which you paid on the catalog is deducted from
the price of the item along with the $3.

Message-ID: <4f6tkn$mkg@usenetw1.news.prodigy.com>
Source record: 240619

Over the past several days, I've noticed that my Bearcat 700A
>scanner is picking up a local AM station, KFI (640 KHz) at
>450.7250 MHz.

If you listen carefully around the news cast and commercials you can
here
the engineer talking giving cues and such!

Scan up and down from that freq during the main TV news hours and
you can listen to the studio talking to the reporters doing "live" shots
while
also listening to whatever the broadcast is.

What you are hearing is being broadcast on the 450.725 in FM mode, as
far as I know it is meant for the field reporters to catch their cues.
Interesting
enough, even though it is ahead of the actuall 640Khz I still do not
hear
people cuss and freak out when they have to "dump" someone. So I think
even that broadcast is delayed some.

Maybe the "Mr News" guy can give more details if he reads this?

The sick thing is that the booger-ball sent me some sexual
propositions by e-mail..... My attorney, in addition to getting him
to stop the harassment, sent Breath's e-mails to a personality profile
shrink. The shrink says Breath has a Freudian fantasy about me, but
that he's harmless. Says Breath is a simpleton whose worst escapades
were pulling the wings off flies and then eating the flies.

The shrink was nonchalant about it, but it makes me sick to think
about it. Oh, the shrink also said Breath was a masochist and just
loves it when people say bad things about him. So I dunno.....
He's a fruitcake if you ask me.

>I am new to this group may not know the history, but bill cheek sure
>makes himself look bad with almost every post he makes. Is this the
>function of a moderator?

Huh? There is no moderator here. As far as looking bad, have you
ever seen me attack or jump anyone without them flapping their liver
lips on me FIRST?

Do take a pause for the cause to review your history before rendering
a judgment or going on "looks".

This newsgroup has a few aspiring snotballs who feel the way to fame,
fortune, and success is to knock over someone who isn't afraid to
stand and be counted.......and then do a little counting of his own.
You're seeing the fallout from a few snotballs biting off just a
little more than they can chew.

Oh....and I don't worry about "looks". It's actually a good thing
that some people go on "looks". That saves me a lot of time,
headache, and hassle later ..... those kinds of people are not from my
tribe and would only waste my time if I let them in. So, in a word,
it's good to see people hastily rise up in arms based on "looks".

I was born uglier than a bastard rat, but just as the sightless have
compensations in the form of heightened hearing, I was blessed with
certain compensations, too. It's really nice to not have to prance
around kissing babies and shaking germ-laden, cocaine dusted hands all
the time. It's nice to just be yourself and to feel free to tell
those who don't like it to eat your shorts. It's nice to walk in your
own moccasins and eat off your own dinner plate.........

Or, would you know?

Hey, there's something wrong with the parts count here.

We've got an old VCR, a scanner, and a camera here. If the VCR and
scanner were close enough, couldn't you get both the scanner front
pannel and that part of the VCR that flashes 12:00 in the same picture?

Yeah, and the FCC has sooo many resources these days. The jammers meet FCC regs so about the only way they could catch you is to PROVE you interfered, a tough call with out any tools to record.

I did two mods
I put the scout plug under the power plug on the left
and I put two stereo plugs one above the other on the right
then I could plug in the scout and both plugs need for the cx12ar.

I cut a piece of ribbon cable and plugged it into the connector
on the radio. This allowed me to hook up all the mods without
soldering to the radio. Worked like a charm.
I sold the 8k though .... Moving on .
It seemed like a nifty radio but I wasn't too happy with quality
It seemed flimsy and doomed to braking.
The audio sucked !
I would have another one ,but not at 500, 400, 300 maybe $250.
anyhow my .02$.

Well let's see, you'll pay more. Oh, that's not an advantage.

If you ever need it serviced, you can take it to the store. The store manager will throw it into their car letting it slide around getting banged up on its trip to the repair center. Ditto the way home. That's kind of an advantage if you don't mind banged up equipment.

Your store personnel will hardly know anything about its operation. Wait, that's a disadvantage.

What was the question again?

Hi,
if anyone is interested in using the PD pocsag decoder software that
has been mentioned here I have a few interfaces that are made on pcb
and built inside a 25 D socket and shell. The only external conection
being a lead to the RX audio. If you would like to know more please
feel free to email me.

>Yes it's modifiable I got the mods

Only SOME pro-46's are modifiable, you need to validate the date code before trying a mod. The older original units are modifiable, the newer date coded ones are not. All pr0-46 mods can be found at the usual place, ftp::rtfm.mit.edu in the usenet_by_group area; dig down into it to find the mods subdirectory.

Hi,

Fire Dispatch for Phoenix is on 154.190

There are a number of other channels 154.25, 154.070, 154.280,
154.310, 154.145, 153.770, 155.670, 151.370, 154.025, 155.775,
154.430.

Police is on 150&450. Do you know what area you will be staying in?
There are 20+ freqs.

Are you interested in Firefighting? We have the largest firefighting
museum in the US here in Phoenix. If your interested see below.

HALL OF FLAME

What is it? It is a museum of Firefighting dedicated to the
preservation of the History of Firefighting.

The Hall of Flame exhibits over 100 pieces of fire apparatus from all
over the world, dating from 1725 to 1961. Also on exhibit are many
additional displays: firemarks, scale models, operating alarm systems,
fire related art, uniforms, and much more.

The Hall of Flame is located at:
6101 East Van Buren St.
Phoenix, Arizona 85008
Call 602-275-3473

Tell them Fireboss sent you!

On Mon, 05 Feb 1996 16:03:08 GMT, you wrote:

3097. Re: DIGITAL CORDLESS PHONES How Secure?

Newsgroup: rec.radio.scanner
Date: 1996-02-06 00:00:00 UTC
From: Brian Kitaoka <bk104@hgea.org>
Message-ID: <4f83b7$drq@hgea01.hgea.org>
Source record: 240643

I'm not an expert on cordless phones but I do have a 900 MHZ digital model and use to have the other 46/49 MHZ before. Here are my notes:

1) The 900 MHZ is very CLEAR and has a better range.

2) The unit works very well every time. I have NEVER heard my neighbors or had interference.

3) I have tried to monitor myself on my scanner but I can't monitor both the base or handset. I have been searching the 900 MHZ range that the spec sheet mentions.

My unit is a Tropez DIGITAL. My only regret is that I didn't get the spead spectrum Uniden (Why, cause I heard on the news the next day that the reviews were good.)

Am I happy with what I have- YES

3098. Pro-2006 & Pro-43 For Sale

>what model of Create antenna they are using.

Hi Gary,

the last time I looked when I had the inside tour, the FCC
definitely did not have a Create L-P on the mast. What they had
was end mounted in the vertical plane rather than center mounted
as both Create models are. Are these antennas that you saw relatively
new? I have not been up on the roof for two years and when I drive by
on the freeway it is hard to see the type of coax without stopping and
pulling out a spotting scope....but I wouldn't want them to think
I was a sniper as the chief's office faces the freeway!

They did have a lot of R7000s at the time though....

Most of the activity is from the USCG Detroit, Michigan Group on Belle Isle. The traffic I've heard is on the main CG frequencies:

157.100
157.050
157.150

They answer distress calls on Channel 16 (156.800) but almost always tell the boater to switch to 157.100 (channel 21A I believe.)

I've heard Sarnia, Ontario Coast Guard radio occasionally on 156.800 and continuous weather can be heard out of Leamington, Ontario on 161.775.

Hope that helps!

Jeff

>County Sheriff's Office on 39.240 MHz using a pl-tone of 123.0
>There you have it. A typical example of what I would like to see in
>future Uniden Bearcat scanners :Base, Mobile and Handheld scanners

And while we're at it. Why not have the scanner decode and display
the pl code on channels that you didn't specify a pl-code on or when
in search mode. That way you would know which codes the worthwhile
channels are using.

Also, a computer interface should pretty much be standard on all
desktop and mobile models and an upgrade on your best handhelds. This
should be a straight 9 pin RS-232 interface on desktop and mobiles.
No need for a special interface. If people want to use multiple
radios, then let them get a multi-serial port for their computers.
Handhelds could use the 9 pin also or a simpler 4 or 5 pin design --
similar to the computer controlled Digital Multi-Meter that Radio
Shack sells. Please, dont do something stupid like the interface on
the AOR8000. Its a great scanner, but the implementation of the
computer interface sucks! They would have been much smarter to design
a charging base, with the computer interface built in to it. There is
a lot to learn from AORs first try AR 8000.

It would be wise to design software for the scanners and release it as
a package deal. Again, learn from AOR. They released an exciting
radio and failed to fully capitalize on the computer interface. By
not offering or providing their own software, the computer interface
seemed more like an afterthought. All UNIDEN scanners should be able
to use the same software and new releases of the software should be
free or very reasonable. You know, new radio, new software, backwards
compatability, $$ for Uniden $$.

Happy designing

3103. CTCSS decoder?

Newsgroup: rec.radio.scanner
Date: 1996-02-06 00:00:00 UTC

I posted a message asking what a CTCSS decoder was and how much
they cost a couple of weeks ago. Unfortunately, I didn't get back to
the internet since. Perhaps my question has already been answered, but
I'll ask again anyway. I was also wondering if anyone might know the
repeater channel that the Niagara Regional Police (Ontario, Canada) use.
I think it's 138.something. My scanner doesn't have a search feature.
Any info would be appreciated. Thanks.

FEBRUARY

Feb 14(Sun) - Wheaton, IL, Computer show. DuPage County
Fairgrounds, County Farm Rd. & Manchester Rd. $6 adult
admission. 9:30 AM - 3 PM. Info, call (708)974-2123.

Feb 18, Sunday: Rock Island, IL - Davenport Hamfest, QCCA |
Expo Center, 2621 - 4th Ave., Rock Island. 7:30 AM - 3:30 |
PM. Admission $6 at door, free parking. VEC testing.
Info, SASE to Kent Williams, 4245 10th St., East Moline, IL
64244. tel (309)796-0718.

Feb 25 (Sun) - Computer Central, College of DuPage (see
notes at the end of this article).

MARCH

Mar 10 (Sun), Waukesha, WI - SE Wisconsin FM Amateur |
Repeater Society Swapfest, Waukesha County Expo Center |
Arena. Exit 294 on I-94 west, then south on C.T. 'J'. |
Setup at 6 AM. Admission $5 at door. Talk-in 146.820 MHz. |
VEC testing. Info: (414)650-0724.

Mar 24 (Sun) - Computer Central, Harper College (see notes
at the end of this article).

March 24, Sunday: Sterling, IL - Sterling-Rock Falls Amateur
Radio Society hamfest 96. Info, call Lloyd Sherman,
(815)336-2434.

March 31, Sunday: Grayslake, IL - LAMARS hamfest, Lake
County fairgrounds. Admission $5 at gate, free parking. |
Setup at 6 AM, doors open at 8 AM. VEC testing. Info:
Francis Avellone, W9GLO 650 Green Bay Rd., Lake Bluff, IL
60044, tel (708)234-4124.

APRIL

April 14 (Sun), Madison, WI - Madision Area Repeater Assn | Swapfest and Computer Fair. Dane County Expo Exhibition | Hall. 4 miles west of Hwy 12 & 18 and I-90 interchange. | Watch for Rimrock Road exit. Doors open at 8 AM. Admission | $6 plus additional parking fee. Kids 10 and under free. | Talk-in on 147.15 MHz, PL 123.0 Hz. Info: (608)245-8890. |

April 21 (Sun), Arthur, IL - Moultrie ARK. Info: Ralph Zancha, WC9V, PO Box 55, Lovington, IL 61937, tel (217)873-5287

April 28 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

April 28 (Sun), Chicago, IL - Chicago ARA Ham Auction. | DeVry Institute of Technology, 3300 N. Campbell Ave. starts | at 12 noon. They will auction your electronic goods if you | bring them in before noon. All goods subject to 10% dona- | tion. If purchased back by the seller, then 5% will be due. | All items sold as-is and all sales final. Info, call Dean | (708)331-7764 morning or evening, or call George (312)545- | 3622 daytime.

MAY *

May 5 (Sun), Sandwich, IL - DeKalb Hamfest. Sandwich Fair- | grounds, intersection of Suydam and Gletty Roads, just north | of Rt. 34. Admission $6 at gate, free parking. Talk-in on | 146.73 MHz and 146.52 MHz. |

May 11 (Sat) - Kankakee Area Radio Society, Peotone, IL. | Will County Fairgrounds, I-57 to exit 327 east. Admission | $5 at gate, free parking. Kids under 12 free. Info: Willis Bowser, K9IFO, 1210 North Riverside Dr., Momence, IL 60954-3452, tel. 815-472-2079

May 26 (Sun), Chicago, IL - Chicago ARC Hamfest. DeVry | Institute of Technology, 3300 N. Campbell. 8 AM - 3 PM, | setup at 6 AM. Admission $5 at door, free parking. Kids | under 12 free. Talk-in 147.225, 444.825. Info, call | (312)545-3622 or (312)486-6823.

May 26 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

JUNE

June 2 (Sun), Princeton, IL - Starved Rock RC. Bureau | County Fairgrounds. Admission $5, free parking. Info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-1710, tel. 815-795-2201 Usually an excellent hamfest, with sellers from Illinois, Iowa, and Wisconsin.

June 9 (Sun), Willow Springs, IL - Six Meter Club of Chi- | cago. Santa Fe Speedway, 91st and Wolf Rd. Gates open 6 | AM. Admission $5 at gate. Talk-in on 146.97 MHz (107.2 PL) |

or 146.52 MHz. Info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Ave., Downers Grove, IL 60516-3925 tel: 708-963-4922. Good | hamfest but, restroom facilities are usually filthy.

Jun 30 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

JULY

Jul 13 (Sat), Oak Creek, WI - S. Milwaukee ARC Swapfest. | American Legion Post 434, Shepard Ave. Admission $5. | Talk-in 146.52 MHz. Info (414)762-3235. |

Jul 14 (Sun), Sugar Grove, IL - Fox River Radio League. | Waubonsee Community College, Rt. 47 at Harter Rd. VEC test- | ing. Admission $5 at gate, free parking. Info: Diana | WD9API, (708)293-7485. Fair, small to mid-sized hamfest. |

Jul 27 (Sat), Pecatonic, IL - Rockford ARA Hamfest. Winne- | bago County Fairgrounds. VEC testing at 1st Baptist Church, | 7th & Washington. Admission $5. Kids 10 and under free. | Info, Marsha Plasters (815)399-9233 or Diana White | (815)645-8545. |

Jul 28 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

AUGUST

August 18 (Sun) - DuPage ARC, Stickney, IL. DuPage ARC Ham- | fest Computer Show. Hawthorne Race Course, 3500 S. Cicero | Ave. Admission $5. Kids under 12 free. Info: Ed Wein- stein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517. tel: 708-985-9256.

August 25 (Sun), Woodstock, IL - Tri-County Radio Group. | McHenry County Fairgrounds, Rt. 47. Admission $5 at gate, | free parking. Kids under 12 free. Info (voice/fax) | (708)658-1678. |

August 25 (Sun) - Vermilion County ARA, Danville, IL. Info: Gary Denison, KA9SKS, 14704 East 2750 North Rd., Danville, IL 61834-5610. tel: 217-759-7389.

August 28 - 30 - Antique Radio Club of Illinois, Elgin, IL. RadioFest96. Holiday Inn Holidome and Convention Center, 345 River Road, Elgin, IL 60123 Ph. (708)695-5000, (847)695-5000 After 01/20/96. 3110. RS Pro 62 problem

Newsgroup: rec.radio.scanner
Date: 1996-02-06 00:00:00 UTC
From: Scott Ryan <crtoy@fyiowa.infi.net>
Message-ID: <4f8pqa$j68@nw002.infi.net>
Source record: 240656

Yesterday I purchased a Pro 62 from the local RS. When trying it today I found that broadcast frequencies (TV, NOAA weather & AM) bleed over other frequencies. Weather frequency 164.475 MHz completely covers a local Police frequency at 159.225 MHz. Turning the squelch down enough to prevent bleed-over cuts reception of ALL frequencies.

Do I have a bad unit or is this a command problem with the Pro 62?

3111. Pro-26 is it worth paying $99.00???????????

Newsgroup: rec.radio.scanner
Date: 1996-02-06 00:00:00 UTC
From: "James J. Lass" <jimlass@loa.com>
Message-ID: <3117F60D.292B@loa.com>

From: gjacek@Cyberstore.ca
Message-ID: <4f6f2n$382@sulla.cyberstore.ca>
Source record: 240664

I recently had the misfortune of having my Pro43 stolen
from a locker, along with some other stuff. My household insurance
company will cover almost everything, except the
scanner.

They say the scanner falls under 'automotive' and they
won't cover it. Has anyone experienced this before?

When I say 'scanner', are they thinking 'radar detector'?

Perhaps I should have called it a computer-controlled
AM/FM radio.

Hmm, I love it.
lets see ....
Ive had a 8k , R1, 43 ,34 , 39
ar2500 and 2006s

I sold my black sc150 , bought a yellow one.
I love it.
Excellent audio
Excellent reception
Sturdy
Clear display
easy programming
l/o on search

I guess you have your reasons for hating it

I see you so clearly posted your complaints

anyhow the sc150 doesn't compare to the ar2500 or 2006
it doesn't compare to the R1

but my opinion is that the pro handhelds and 8k are junky.
I've had them all apart and the Icoms and SC150 are

in my opinion "put together better"

I'm not one to weight the cellular stuff to heavy ... but
if it is a good scanner you are after the sc150 is worth the $160 !!

3125. Re: Uniden BC350A (opinions)

I have 2 BC 350A's. Both are VERY intermod prone, not good for big cities
with
lot of RFI, but good for low cost scanner. Easy to program, Kinda
aggravating
to get to one specific freq. though. No direct entry, got to search till
you hit
freq. Go ahead and get the BC700A or the Beartracker 7. Both have
800Mhz coverage, with you can't do without these days!!
Good luck and let me know if you have any more questions.

I am looking for a tabletop with ssb & vfo. (Sideband, and a Tuning knob)
Must be in good shape.

I currently have a pro 2006 which is nice, but I am a 6 meter fan, and
I'd like to monitor 6m for band openings, etc without having to put the
IF out into a communications reciever.

The 2006 is up for trade, as well as the Sony SW-100S. I have boxes, and
manuals for both.

I guess I may take interest in a handheld, but only a GOOD one, like the
Yupi 7100/7200.

Thanks,

Nate Gingras, KB9LSX

It most certainly is! It becomes "my business" when these people drive on the highway, endangering my life. If I'm a business owner, it is also "my business" when these folks cost me money in the form of lower productivity, increased "sick time" off of work, and making bad decisions on the job, due to their drug or alcohol-induced state.

From: klimasewski@fccvde.enet.dec.com
Message-ID: <4fb217$d6v@mrnews.mro.dec.com>
Source record: 240441

I have designed a switching scheme that allows the user to select
the stock 12KHz AM filter or the narrow SSB 4.0KHz while still in
the AM mode. I have found this to make a BIG difference when trying
to receive a weak shortwave station next to a very strong one.
The only part required is a switch and some wire.
My mod has no effect on the use of the DS8000 speech inversion accessory.

Send me email if interested.

From: <>
Message-ID: <4f912d$p0n@news.cais.com>
Source record: 240443

I am interested in purchasing a mobile/base scanner but have little
information and no experience in this particular hobby. After reading
the backlog in this group and alt.radio.scanner, I believe the following
features would be desireable:

Police/Fire/Ambulance/DOT coverage.
Radiowave detection (VASCAR, Aircraft)
HAM frequencies, especially 2m and 72cm
Weather Alert

Could someone advice me as to what other features I should look for in
a scanner (MultiBand, 800Mhz, etc) and what such features actually
do (both to the scanner's capabilities and the price - I would like to
stay below $300). Product recommendations would also be appreciated.

Thanks for the assistance, and if any of the above are FAQ, just point
me to the archive site.

Well, that explains EVERYTHING. Magnets have a really
hard time adhering to that fiberglass. :-)

BTW... two points on the topic. I used a Larsen mag mount for
about 6 years for a ham radio (2 meter) antenna and never had
any trouble; it had a really strong magnet and didn't move
at up to 80 mph. I had it on a VW Scirocco (which could do
over 100).

Also, there are a lot of mag mounts that take the 3/8" x 24
threaded antennas, and there are a LOT of antennas (including
scanner antennas) that are available in this threading.
Some of these mag mounts are rated for large HF/shortwave
ham antennas.

I would not even begin to compare Rat Shack with McDonalds. First
McDonalds' prices are competitive. Second, their quality is high
and consistant. Service can vary but it is generally good.
McDonalds typically supports the communities where their stores are
located. McDonalds employees are not fired every so many months so
the local stores' personnel is fairly steady.

On the other hand, RS is just the opposite.

I beg to differ with you if your RadioShack salesman has completed all
of his or her Radio Shack Certification Tests there is very little
thay can't answer. Most of the time it's not a matter of not knowing,
it's a matter of not wanting tobe bothered by all of the customer's
anoying little projects. Remember we are here to sell not build your
project; that is your job. Also, keep in mind "You've got question,
We've got answers" and the answer can be NO!!!

Sincerly,

Len Roberts, President Tandy Corp, and RadioShack

The Pro 26 gets my vote.
It goes down to 25MHz so it gets CB and 29MHz ham. Goes up to 1300MHz (although I haven't heard anything up there yet). Uses only 4 AA Batts, yet charges @9V. It's smaller and lighter than the Pro 60. Searches in 5 MHz mode at 300 steps/second, scans at 50ch/second. Has data skip and skip search in search mode to glide over noise and birdies etc.It autostores freqs into a bank in search mode.
It costs $70 more.
Is it worth it to ya?
Good luck with your choice, it's not an easy one.

The 2035 and 2042 can be modded to receive cellular but it's pricey: Buy
the Optoscan 535 computer interface (about $300). If it's the US model,
you can apply a software "unlock code," which is floating around on
various sites, including here. Or you can buy a Canadian model that does
not require the unlock code. You can also replace the scanner's CPU with
one that is available overseas from Javiation and other companies. Not
sure about the price, however. Probably not any cheaper than an Opto,
which gives you additional capabilities.

Good Morning-

I was hoping for some advice on the 8000 and computer control. I have heard that the Opto CX12AR and Scan*Star is the best combination to use...is this true?

1) Does the CX12AR require any mods to the radio?

2) Is Scan*Star Commercial better (equal/worse) than the SE or Plus versions for windows? I guess I would prefer a windows based program as long as it works the same.

3) How well does it work?

4) Does the Radio Shack telescopic scanner antenna do the job, or would you recommend a diiferent antenna.

I would really appreciate any feedback or information on this subject! Thanks.

-Perry Hayes

From: Henry Valera <Henry_Valera@ftl03.racal.com>
Message-ID: <4favcq$72g@news.internetmci.com>
Source record: 240501

I recently sent my 200xlt to Radio Shack for repair and they returned it as "unrepairable". They said the Main Logic Board was shot and that Uniden does not stock that part. A few people have said that diagnosis did not sound right and to call Uniden myself. Well, I've tried calling the six different 1-800 numbers they have and they're always busy. So I'm back to where I started. Any suggestions would be greatly appreciated as far as where to send it for repair.

BTW, the symptons of the radio are no audio, no light, never locks on a freq.

Thanks in advance,

Henry.

Karen

Radar stands for Radio Detection and Ranging. Radars operate at all
different frequencies dependent upon their purpose. All radars operate in a
pulsed mode. The transmitter sends a pulse to an antenna then the receiver
waits for a return pulse. The time it takes to recieve a particular echo
will give you a range to target.

There are a number of different techniques used for transmitting and
receiving depending on what you are trying to accomplish.

To answer your question, I'm assuming you mean radar used by police.
The short answer is NO.
Because, they operate in the 7~10 Gigahertz spectrum. I don't know of any
scanner that can receive anything over 2Ghz.
Even if they were in the 400MHz region it would do you no good. Most
scanners (bearcat 200xl and such) operate in the Amplitude Modulation (AM)
mode. More expensive scanners or all band receivers (ICOM) have FM and
sideband modes. Even these recievers will not lock on radar pulses.

Radar pulses are very directional. As an example I maintain a radar system
that is used to do science and track sattelites. It operates in the 440Mhz
region. Our output power is nominally 2.5Mw. (see Web Site
http:hyperion.haystack.edu).
Our beam is approx 1degree wide. If I had a receiver capable of locking on
to a pulsed signal and I were standing 10 degrees off to the side of where
the antenna is pointed then I still would not receive anything.

Not all antenne are as directional as a parabolic dish. I just used this as
an example. I did not take into account the magnitude of the signal or side
lobe strength into this brief note.

Happy scanning
Chris

I can envision the message titles of the future:

If the serial# of your 8000 is XXXX or greater then you can't open the cellular.

Why can't I get cellular on my 8000?

For sale: 8000 with 800 mhz restored, not available in stores.

Thanks Grove for nothing. I consider this to be the beginning of end of the
restorable 8000's. At least if the FCC does require the bandplan in ROM, my
8000 will surely hold it's value.

Steve

3173. OS/535 unlock code. Does it work?

In January, someone named "Eric" posted three zip files on rec.radio.scanner that he described as a shareware program to unlock the OS/535 board. I could not get his files to work, or even to unzip correctly. Did anyone have luck and, if you did, would you be willing to repost the files? Did anyone archive the files at a modification site? Thanks very much.

I tried emailing Eric, but my mail was returned undelivered. Thanks Eric, whoever you are, for sharing the program in the first place. It sounded cool. If you're reading this, please email me.

I have a Recoton Portable Power Station that I like quite a bit (I think they are now marketed by ANLI). They have a built-in voltage meter and a switchable output for 3-6-9 volts, as well as a dedicated "cigarette lighter" style 12 volt jack. I also have a portable battery built to power a Q-Beam spotlight which is nothing but 12 amps of pure power in a small pack with a carry strap. Either of these should keep your 12-volt scanner (cell phone, HT, etc.) going for many hours. I would tend to steer clear of the car batteries because of the potential associated dangers.

Also, there is an article in the April, 1995 Monitoring Times magazine about scanning in emergency situations.

3177. POCSAG Decoder Available from SimTel Archive

Newsgroup: rec.radio.scanner
Date: 1996-02-07 00:00:00 UTC
From: Pete Baston <pete@bearnet.demon.co.uk>
Message-ID: <pCvsvFALWPGxEw4M@bearnet.demon.co.uk>
Source record: 240519

The latest version of my POCSAG Decoder, PD 2.00, is now available from the SimTel shareware archive. The software and documentation can be found in file SimTel/msdos/paging/pd-200.zip on the prime mirror site, FTP.Coast.NET, and also on the secondary mirror sites. For a list of SimTel mirror sites please email me directly.

Pete Baston
pete@bearnet.demon.co.uk

SimTel Announcement Follows:

SimTel/msdos/paging/
pd-200.zip POCSAG paging decoder version 2.00

PD Version 2.00 allows the off-air decoding of POCSAG paging transmissions. The program supports POCSAG speeds of 512, 1200 or 2400 bits/second and decodes alphanumeric or numeric paging messages. A simple interface is required to convert the audio output of a receiver or scanner to RS232 levels, for input to a COM port on a PC.

Special Requirements: Interface circuit. Details given in documentation file (pd200.txt).

Changes: The following improvements were made over the previous version (version 1.02):-

* Now supports 2400 baud and has auto bit-rate detection.
* Will now attempt to correct up to 2 bit errors in a codeword.
* Will now attempt to auto-detect numeric or alphanumeric data.
* Now supports logging of all messages to daily log files.
* Logging now continues whilst in PAUSE mode.
* PAGERS.INI and REJECT.INI will now allow comments after pager addresses.
* PAGERS.INI and REJECT.INI will now allow wildcards in pager addresses.
* PAGERS.INI and REJECT.INI will now accept up to 250 entries each.
* Date format may now be configured for the US market.
* Will now correctly display "umlaute" characters used in German.
* Screen colours may now be configured.

pd-200.zip has replaced pd-102.zip.

Shareware. Uploaded by the author.

When I go to Radio Shack, even when the people are nice (99 percent of the time) I know _I'm_ going to have to train the saleperson so that they can just get me the right item off the rack. And I'm not talking about anything "technical" like a resistor. I'm talking about things like patch cords or antenna brackets.

The problem is they don't pay their people enough and they don't train them at all. If a person knows a thing or two about electronics they can make better money swapping computer boards in the field or something. It's not the fault of the employees. It's with Shack's management's get-rich-quick mentality. They don't have a clue and they don't care. Never did, in my opinion. "You have questions?" It's a joke.

Unfortunately, in many communities Radio Shack is the only place to go for everything in their catalog. Yikes! Oh, well. Thanks for the bandwidth.

This has long been a gripe of mine, too.

Don't know if it's the one you want but try PerCon Corp at
http://perconcorp.com/db_srch.htm
Did I leave ot the www bit ? Anyway, you can use a search engine to find
it.
BTW I found it by using the Alta Vista engine...it has a usenet search
function which is really usefull if you want to check something on a
newsgroup.
While on the subject, have a look at the ISYS site for a shareware (free
?) download of HindSite. This little beauty runs with Netscape and
indexes your cache to allow quick recall of urls you forgot to Bookmark.
I have been using it for a couple of days and couldn't live without it
now. You REALLY should have alook.

Message-ID: <4f9e6v$caf@merlin.delphi.com>
Source record: 240530

The AM radio station that you are hearing on the UHF frequency uses that frequency as a remote for the reporter in the field. The reason it is time delayed ahead of the actual AM station is for security reason such as a slip up on fowl language. I live in the Boston area and most of the local radio and tv stations use 450-452 MHZ for remote broadcast.

I hope this answers your question. If you want additional info on these frequency, pick up a Police Call Book. Those freqs. are all listed in there.

Good luck!
Tom McMath

Mike -
Caveat empmtor (buyer beware). Make sure the PD radio shop will pop
for the channel elements for any radios you purchase or check the
price for "crystalling" the radios - the cost can be prohibitive
and, therefore, you might look into buying new or late model used
programmable radios. Make sure they support the coding features
your department uses PL tone, CTCSS tones, whatever it might be.

>
A DTMF decoder is:'Dual Tone Multiple Frequency'.decoder.
Your touch tone telephone uses this scheme to transmit digits. The tones you hear are dual tones, each one a different frequency set for each digit dialed. A 'decoder' decoders these tones into a digit, e.g. 0 to 9 plus A-D and # and *. Check out the Motorola MC145436AP decoder IC (or others).
I wrote a program for my PC and this IC to decode tones heard from my scanner...it ain't hard to do.
Beep beep to digits, simple.

Hi there... I was wondering if you had any motorola Ht's on the 500 mhz band... my explorer group has recieved authorization from the Police dept to use their frequencies, and we could really use a few for field events... We will need one multi channel radio, and the rest can be dual, or single channel.... Thanks...
Please send your prices to...

This is what I have on Australia:

148.0125 -> 149.0000

there are plenty in there, nearly all of the vhf stuff.

also 149.8125, 149.8375, 149.8875 and 153.800.

TD.

I caught that last night too! I was scanning around when I heard "Sam 1" asking for the ETA of a Cutter to the area, but never heard what the actual problem was till I got up this morning and heard the news. "Sam 1" also said he would be listnening on 5.696 and an 8 Mhz freq, but left the spec-fx at home.

In the november 1995 issue of Popular Communications you will see an
AD for cellular modifications to Bearcat models BC-2500, BC-3000
BC-8500, BC-9000, BC-700 and Realistic PRO-2035. The AD goes on to
say it will send well explained and illustrated steps to the
modifications for the sum of $7. May be of interest to earlier
posts on Bearcat mods. Nice to hear from anyone that had it done
to see if it really works.

Bob,

There are a few more or less 'established' IRC channels for this
purpose. If you are into monitoring utility and military shortwave
stations, you might want to try channel #wun on Sundays at 2300z.

If you are interested in military aero communications, you could
try channel #airband on Monday, Wednesday and Friday evenings
at 2000 UTC. Will meet you there, best regards.

Rene / Aerocom.

Yes, you can add an extra whip to the top of your discone. The only problem is the thread, it's 5/16x (I forget the pitch) so you need to make a sleeve that goes to 3/8. Use a 5/16x? drill and tap one side for 3/8, add a stud if necessary. Then just add your whip to the top. I used radio shacks off road cb antenna w/coil. I saw major increases in signal strength below about 160Mhz, Below 50Mhz saw the most gain, naturaly. BTW, this mod had no ill effects on higher freqs. Good listening.

From: "Fred Zuschlag", dpeep@GnetNET.net
Message-ID: <311a74de.20796218@news.gnatnet.net>
Source record: 240389

On 8 Feb 1996 08:04:47 GMT, derek@comlab.gtri.gatech.edu (Derek B. Cook) wrote:

>I was wondering if anyone could provide me with information on frequencies >used at Hartsfield International Airport in Atlanta.

Each airport uses certain frequencies for planes to communicate with flight controllers. The frequencies are the same at a given airport regardless of who is talking. Hope the following helps. My source is a bit old, but last time I was there most of them were busy.

Approach control 118.350
Approach control 127.900
Approach control 126.900
Approach control 127.250
ATIS, arriving 119.650
ATIS, departing 125.550
Clearance delivery 121.650
Departure control 125.000
Departure control 125.700
Gate control 125.325
Ground control 121.750
Ground control 121.900
Pre-Taxi clearance 121.650
Tower 119.100
Tower 119.500
Tower 123.850
Unicom 122.950

ATIS stands for Auto Terminal Information Service, which provides hourly-updated prerecorded information, such as weather conditions, runways in use, special hazards (certain taxiways out of service) and other useful information to arriving or departing aircraft.

Also listen for several airlines in the 460 MHz range, between 460.500 and 460.975. These are usually used for airline operations on the ground (Hey, Chuch, we need three more meals at gate A-35) and the like.

Enjoy!

Fred

Message-ID: <00001ff6+00004529@msn.com>
Source record: 240403

if you should do a little math you will find that the slight mismatch between the 50 ohm scanner and the 75 ohm cable will more than offset the loss you have with rg58 cable. In many instances if the cable run is over 30ft or so you will end up receiving better using 75 ohm coax.
The ultimate would be to use lossless coax. That big bucks to you and me even if you were to use beleden rg9913 at about 1.50$ per foot you would almost do better with rg6 75 ohm coax. If this were a transmitter you are correct. The mismatch would be terrible. Hope this clears up thing a little.

Another idea with the poor receive might be front end overload. You could verify this by using the rubber duck antenna. If your receive improves over the outside antenna you might have too much signal entering the scanner.

As another test you could also try the outside antenna with a 3 to 10 foot piece of 52 ohm coax. If you notice more signals you might want to
reposition your antenna closer to your scanner.

good luck Mitch

The pro2020 Its a no thrills scanner. No 800mhz recieve. General coverage. Some modifications are available. for example you could add
a number channels. you can also change the 406-512 band to 380-480. other than that you should not have to pay much more than 40 bucks.

>price? THanks!!!

Although I'm not in the market, I'd pay $120-$150 for a used
PRO-2037 in excellent condition, with manual and antenna.
I wouldn't pay any more than $150, though.

Make sure the display is crisp -- not faded or blotchy. The
PRO-2037 uses LEDs instead of a short-life electroluminescent
panel for backlighting.

From the "Buying a Used Scanner" FAQ:

PRO-2037: 1994 vintage. Triple conversion all plastic base
scanner made by GRE. Home version of the PRO-62 portable
but with more intermod. 200 channels in 10 banks, one
search bank, selectable AM and FM. Uses up conversion
circuitry but inadequate front end filtering still allows
images, though not as bad as in 10.7 or 10.8 MHz IF
circuits. Crisp, respectable audio given the top mounted
speaker. See "The Radio Shack PRO-2037," by Bob Parnass,
in July 1995 Monitoring Times.

I believe there is a company called Sport Comm in your area that handles the Maxon 210+3 handhelds. I do not recall their phone # or address. As mentioned in another message Communications Electronics has the best price around on the 210+3. This unit can used through a repeater if one is available in your area possibly eliminating the need for a 25 watt mobile. The 210+3 comes with a battery that allows 2 watts on transmit. Another battery is available that boosts the power to 4 watts and when used with the car power adapter you'll have 5 watts. The 210+3 operates on 2 of the main GMRS channels plus the REACT channel and will also operate on all of the interstitial channels.

I have the RS mag-mount scanner antenna. I use it quite well on my
Cherokee, and haven't had any problems with it coming off, even at
speeds in excess of 75 MPH. Now hitting low ceilings in drive-thrus,
parking garages, and the like is another story... :)

However, I did replace the connector on the end with a twist-on BNC
to fit my Pro-39. The RS Motorola-to-BNC adaptor doesn't seem to fit
much of anything worth a damn. (I'm going to replace the connector
with a solder-on BNC 'one of these days...')

3240. Intelligence on AID/Westinghouse bugs

Newsgroup: rec.radio.scanner
Date: 1996-02-08 00:00:00 UTC
From: jmatk@tscm.com
Message-ID: <jmatk-0802960005220001@jmatk.tiac.net>
Source record: 240458
Cross-posted to: alt.conspiracy,rec.radio.scanner,rec.radio.shortwave,alt.radio.scanner

All TSCM people have heard about AID devices, but few know the actual freq they use, or what they look like.

The devices are VERY popular with the law enforcement crowd, private investigators and corporate security types. The equipment is VERY overpriced, and the fairly easy to detect.

AID bills itself as "The World's Largest Manufacturer of Electronic Intelligence Equipment and Specialized Protective Systems"

AID was founded in 1970, and was sold in 92/93 to Westinghouse (Westinghouse is currently selling TONS of equipment to the DEA and State dept)

AID - Westinghouse/Audio Intelligence Devices, Inc. Bug Freqs

150 mhz - 174 mhz Standard/Primary Band (Most Popular)
135 mhz - 150 mhz Special Order/Secondary Band
216 mhz - 220 mhz Special Order
400 mhz - 470 mhz UHF Repeaters

36 mhz - 39 mhz Very Low Power WFM (.5mw - 50mw) ***Very Dangerous***
80 khz - 200 khz "Line Carrier" Miscrophone Systems ***Very Dangerous***

1700mhz - 1900mhz 25-250mw Video and audio bugs (Mostly DEA/DOJ stuff)
2450mhz - 2484mhz 25-250mw Video and audio bugs

If the signal is "scrambled" it is nothing more than simple voice inversion, a circuit to "de-scramble" costs around $20.

Note: AID devices are often re-tuned for outband channels... so be careful.

The area of spectrum from 35mhz to 500mhz is the primary threat, 500mhz to 3ghz is the secondary threat, a "line carrier" threat is from 30khz to 750khz.

If the person planting the bug suspects that a TSCM may be conducted then AID suggests a frequency between 30mhz to 50mhz, sensitivity of rcvr should be better than .18uv/-122dbm.

Also, keep in mind that AID devices are frequently used for illegal buggings, so be familiar with what their realistic specs are, expect power outputs under 50mw, and expect to see the AC power circuits being used as the antennae.

-jma

The unit is perfect condition. The guy buys a new models as they come out and he just updated. He wanted $200 for it, but he dropped to $150. He is throwing in an external speaker, some books and other "charts".... I would buy it, but I would like to get a modifiable unit.

I am new to the scanner world, and I do not want to buy something I will need (want) to update in 6 months. I also think a hand-held might be nicer... Do you have any opinions or suggestions for me? Specific models to look for?

Thanks a LOT for the informative reply!!!

IR LED's have a number of different wavelengths. Many are centered
around 820 nanoMeters because the diodes for that wavelength are cheap and
efficient. Laser diodes are often built to operate there too. The real
answer is 700 to 1100 nM.

>Also a narrower band than 700nm -
>1100nm for police laser guns would be appreciated.

See above. Laser speed guns could use any of a number of different
wavelengths in that range. You'd have to know which brand and model to
know the exact wavelength.

Subject: PRO-2026 MODS!!!
Date: 20 Oct 92 14:55:50 GMT
Organization: Rutgers Univ., New Brunswick, N.J.
Lines: 29

Hi all, just got these mods, hot off the FAX!

Note: It is not lawful to monitor cellular or conventional mobile
telephone conversations.

The 2026 has cellular frequencies deleted at the factory, but
restoration is the easiest ever! - clip one marked wire! All you need
is a Philips screwdriver and wire cutters.

1. Turn the scanner upside-down and remove the four side screws
holding the bottom cover in place; pull the cover loose and set it
back about two inches out of the way.

2. Locate the small circuit board at the lower right-hand corner and
find jumper L201. Cut it and slightly separate the break.

3. Reassemble the radio which now has continuous 806-956 MHz coverage
and 30KHz search increments in the cellular band.

*** I have not tried the above mod, but did acquire it from a
commercial radio dealer who is very respectable, so as always, proceed
at your own risk and realize that this will violate your warranty!

Have Fun!

There are two mods that I know of. One requires a minor hardware
modification, the other is simply a hidden mode that is available via
holding down the 3 + # + B keys.

For more information on both of these mods, refer to the simtel
mirrors and look under the icom directory.

I'm looking between Radio Shack's PRO-26 and PRO-60 handheld scanners. I'm leaning towards the 26 even it is more expensive. I'm wandering though about conversion to receive cellphone calls so I can check out my cellphone transmissions once in a while to make sure it is working right? Is the 26 easy to convert and where might I find this information?

3253. FS: Radio Shack Pro-43

Newsgroup: rec.radio.scanner
Date: 1996-02-08 00:00:00 UTC
From: szoubok@bway.net
Message-ID: <szoubok-0802960805150001@dial59.bway.net>
Source record: 240471

Hi all,

Having gotten away from scanning as a hobby, I'm selling my last scanner: a Radio Shack Pro-43. The scanner has had the cellular and "beep elimination" mods applied. It is in excellent condition. Included with scanner are:the belt clip, the stock antenna, the RS telescopic antenna (metal, with coil, model number ?), the Condor antenna, the RS padded belt case, and the AC adaptor/charger.

I am asking $250 FIRM, including insured shipping. Delivery will take the form of a COD shipment and payment must be in the form of a Postal Money Order.

Also, please note that I am selling this as a package and am not interested in breaking up the set. The price reflects, in my opinion, the value of the scanner with the rest of the stuff "throw in" (I won't be needing it).

If the above terms are acceptable and you are interested, please email me directly.

Thanks for your attention,

Sergej

: >> -->Is it possible to listen in on Cordless Phones using a scanner?

: >> No it is not. Your congressman has voted to make it illeagal to listen to
: >> such transmissions

THAT'A A BUNCH OF BULL! THE CORDLESS FREQUENCIES ARE LISTED BELOW, ALSO
IF ANYONE WANTS ALL THE CELLULAR FREQUENCIES IN YOUR AREA, LET ME KNOW, I'LL
BE HAPPY TO GETT THEM OFF OF THE CD I HAVE...

you qwant privacy, then scramble your calls, get a digital phone or use
an old fashoned LAND LINE!...Monitoring radio phones (cordless, Cellular,
IMTS, & Phone patches) can be REAL INTERESTING & ENTERTAINING!

: >Lots of cordless activity here:
: >46.61 46.63 46.67 46.71 46.73 46.77 46.83 46.87 46.93 46.97

: >Not so much yet:
: >43.72 43,74 43.82 43.84 43.92 43.96 44.12 44.15 44.18 44.20 44.32 44.36
: >44.4 44.46 44.48

: This is decent info. Don't forget:
: 49.670 49.770 49.830 49.845 49.860 49.875 49.890 49.930 49.970
49.990

cellular frequencies are in the 825-850 (mobile) and 870-896mhz range!
your scanner usually can hear several cell sites at once so you've got
plenty of stuff to listen to!

>
>Bill Funk
>

Well, I have many problems with the local Radio Shack. First of all,
every time I go in there, I get mobed by about 5 sales people asking if I
need help. That's okay, because I tell them I know what I want already,
but they still follow me around. When I can't find something and finally
ask them if they have it in stock, the go to their book (which usually
means they have no idea what I'm talking about.). And ofcourse, the book
tells them that they don't have it in stock and they have to order it for
me. If I wanted to order something, I'd do it through the mail which
would be quicker and probably a better quality than what I could get at RS.

It's not only the salespeople that are the problem. It's the managers
and owners. They don't even know what they're selling. I applied to
work there, but since I didn't have any "retail" experience, they didn't
hire me. But they did hire three total incompetants! Sure, they might
have retail experience, but they don't know anything about electronics.
It wouldn't hurt them to walk around the store actually "LOOKING" at the
merchandise.

I don't know, what can you do? I mean it seems to be a global problem
with RS stores. And to top it off, I can't even find all the things I
need in their catalog.

I found one a guy wrote that works _REALLY_ well on my 486/66
+ Soundblaster 1.0 combination.

But the dork released it as shareware and it is SEVERLY crippled.
It will only decode the first 5 tones and then it quits.

Lame. I threw it in my debugger the other night and got a little
bit with it and plan to work it over some this weekend.

Otherwise, I'm writing my own. Cya..

If they did't want us to listen to them they would use scramblers.
Until I id the station, how can I know that it is licenced under part 90
or part 74 or licensed at all. It appears that the FCC has more
important things to do that look for scanner listeners or to check if
licenses are proper. In our area farmers use marine band radios to
conduct business, the local CBer runs over 500w tearing up most

electronic gadgets and the FCC is not interested. This looks like an easy way for the FCC to justify their existance, rather that selling frequencies that they do not even own. They almost caused large international incidents by rendering communications in Canada and Mexico almosy useless on certain freqs when they illegally established the Citizens Band. ITU requirement that operations below 30 MHz MUST demonstrate a proficency in Morse code to operate.

: on the job, due to their drug or alcohol-induced state.

You don't need drug testing for that. Being impaired on the job is sufficient by itself, as is poor performance of job duties.

Now, what would be reasonable is impairment testing - for those that could cause hazards for others on the job.

The problem with drug testing is that it does nothing to show whether the person is impaired or not, except for alcohol metabolites. And, no company that I know about tests for intoxication.

Aside from alcoholism, I know of no decent studies that show the various drug users have any difference in attendence records, much less sick-time off. There ARE a lot of government apocryphal claims, however.

Now, should a person take recreational drugs? Personally, I think they are stupid to do so - there must be other things to do. However, I also feel that such usage is a personal choice - as long as they are not endangering someone else. That means that anyone who operates a vehicle while impaired should be locked up - and that does not mean only "impaired by drugs".

I haven't found any. That is why I bought the AEA Acars outfit. It works like a charm, and I think it was worth the $90 spent for it. The Lowes AirMaster is the same thing (right down to the software from what I have seen), but costs more $$.

If you ever listen to a conversation between a typical salesdroid and a typical customer, it is really a case of the blind leading the blind. So I would imagine that for 95% of their customer base, it doesn't matter if the salesdroid is knowledgable or not.

Maybe it is a case of the bean-counters calling the shots. It may actually improve the bottom line if the sailsdroid is technically ingnorant. He can sell the wrong thing and not have it bother his concious. And the non-techs will probably work cheaper.

Too bad. Radio Shack has some decent products. And a great market presence. If I was in charge, I'd take the droids off of commision, encourage hiring of hackers and hams, and give the rest training.

From a college dorm, I pick up people through my scanner within my dorm. I am sure it is the campus' own radio airwaves and the tight enclosure of the building I am in that I cannot pick up such great ranges. Though I am only using a rubber duck antenna vs. when I am at home/in my car using a magmount, I can pick up people from a much greater distance.

My only suggestion would be to find a cassette recorder that has both the regular 1 7/8 ips speed (standard) and also the slower 15/16 ips speed. At the 15/16 ips speed, you can record 240 rather than 120 minutes, but, this is not going to give very good quality and should be used only for voice recording in a situation where all you need is an "audio log"--like the audio you see played from 911 calls, for example. I can't imagine a standard cassette that will ever be able to do 3 hrs. because the tape in a 120 min. one is already so thin just to let that much fit into the cassette housing. What about setting up a VCR to do audio-only recording? Some people use hi-fi VCRs as audio mastering tapes...
Good luck.

> what does a tone board do?

It keeps the speaker muted until a signal is received that has a tone on it that is the same as your tone board is tuned to. These tones are subaudible (67HZ to somewhere around 200 HZ). These tones are used to allow many users on the same channel without everyone having to hear everything that is going on on the channel.

3280. Beta Testers Wanted: Scanner Modification

Newsgroup: rec.radio.scanner
Date: 1996-02-09 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <4ff771$s90@news2.cts.com>
Source record: 240340
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Wanted: Beta Testers

For a neat scanner modification kit for the Realistic PRO-2004,
PRO-2005, PRO-2006, PRO-2035, and PRO-2042 scanners.

Qualifications required:

1. Must own one of the above five scanners in good operating
condition.

2. Must be able to read and follow written English instructions.

3. Must have and be able to use a soldering pencil and basic
electronic hand tools, including a voltmeter.

4. Must be willing and capable to assemble a simple electronic
circuit from supplied materials and parts and to install it
in one of the above five scanners. The modification requires
installation of an SPST switch on the scanner's front, rear,
top or side panels, and internal mounting/wiring of the
finished circuit board that measures about 1.3" x 2".

5. Must have e-mail capability and use it to report results and to
get technical support on a timely basis.

6. Must perform the beta test work and report results within a
maximum of 7-days of receipt of instructions and materials.

7. Must be age 16 or older.

8. Must have a "beta tester's attitude"; i.e., be adventuresome,
persistent, innovative, ingenious, and a little crazy.

Other information
=================

Approximately 5 to 10 beta testers are needed to test the clarity
of my written instructions and diagrams. The modification has
already been tested and proved. It works and it works very well,
but I need to be able to tell others how to build and install it.
The beta testers will help me clarify my instructions.

If interested in participating in this beta test, send e-mail to:

bcheek@cts.com

and briefly describe your skills, abilities, and capabilities to
perform the work in a short period of time (7-days). There will be a

nominal, non-refundable charge for the beta materials. Do NOT apply if you do not have one of the five mentioned scanners, or if you are not willing to modify it a little. Casual inquiries about the beta test and non-serious applicants will not be answered.

I will reply to serious applicants with a detailed explanation of the modification, the beta test, and what is expected of the beta testers.

The beta test will be conducted exclusively by e-mail. Technical support by e-mail, will be provided on a timely basis as needed to guide you to success with the modification.

My local rs store has an employee that can set a UHF (470 MHZ)
transmitter on freq with an oscope. Thats 2.5KHz at 470 MHZ. When I
asked him how he was able to resolve a 470MHz signal to 2.5KHz on a
scope, he replied "the scope goes to at least 1 GHz and I used my 100 to
1 freq divider probe. By this time this guys eyes were getting verrrry
brown. You can guess what was causing the brown color.

Check out the article in the current Popular Communications (I believe)
entiltled "The Virtual Converter". This discusses a type of modification to
the front-end filter switching inside a typical scanner.

In a nutshell, you ENABLE the 800Mhz front end amp/filter while tuning in an
unrestricted band at lower frequency for images. Apparently it works quite
well!

The article even includes a schematic or two (using current Radio Shack
scanners for demonstration).

I'd like to see Uniden make the following scanner:
handheld
500 channels (5 supergroups of 10 groups of 10 channels)
covers 30Mhz-2Ghz (or reasonable portion)
good intermod rejection
PL decode
interchangable battery packs.
Full sized
battery good for 6-8 hours
able to run directly from 13.8vdc
a brick. (along the lines of a Saber, MX350, or Icom IC-32)
under $400

With SSB, and Tuning knob, as well as tuning increments PROGRAMMABLE
from .1khz - 1 mhz with no default

A computer interrface would be nice. Coverage to 2 gig would be cool, and
a more compact size would be appreciated, as long as one did not have to
sacrifice filtering capability.

Cantel is making things more secure by adding *more* noise, thus it's
harder to understand conversations when you eavesdrop. :)
As if Cantel doesn't suck already for noise/covverage. Whenever
someone calls me from a cell and I say "you're on Cantel", they reply
"how did you know?". Obviously b/c I can barely hear them.

Correct. "If" and "when" are the operative words. Lots of folks can handle substances
-- some cannot. Action is only necessary when performance is affected, not before.
That, my friend, is called "prior restraint".

My experience has been quite the opposite. I drive about 50,000 miles per year through central and west Texas and find that a Radio Shack mobile scanner gives much better reception than the rubber duckie -- if it is on a car. These beasts are designed with the metal of the car body in mind. If you try to use sit one on a wooden shelf inside your house, you will get terrible reception.

HELLOOOOO! Anybody home? Who mentioned anything about "driving on the highway"?

We already have laws dealing with "driving under the influence", etc. Pray tell what harm is there when one excercises the right to consume substances of choice without harming others? None, but you appear to be afraid when others do, though.

>If I'm a business owner, it is also
>"my business" when these folks cost me money in the form of lower

>on the job, due to their drug or alcohol-induced state.

Fine. Do what you want with your "business". Inspect your employees' brain waves for "non-PC-thought". Inspect their car's speedometers to see if they ever drove over 65mph. (BTW, any employee who works for you under these conditions has infinitely low self-esteem, IMNSHO.) Go ahead an treat your employees like irresponsible crap, but you won't be selling *me* any antennas.

If "your business" is having problems with employees' "low productivity", "increased sick time", "off work", etc. there is a simple solution -- fire their a**es and hire workers who can do the job right.

>

I thought it was the other way around. When the customer is "blind" you need a salesperson that can see. So I'd say MOST of the time you need knowledgeable staff.

Optoelectronics announces a special price for the Scout for the entire month of February.
The Special price is $399 plus you receive a free CC30 carrying case. The regular price for the Scout is $449 and the CC30 has a $10 value. That's a savings of $60.
All orders must be received by February 29th. This special is limited to U.S. and Canadian customers only.
Contact Optoelectronics at 1-800-327-5912 or 1-954-771-2050. You must mention that you saw this special on the Internet.
For further information on the Scout see our Web page:
http://www.optoelectronics.com
Shipping and handling is extra.

Sincerely,

Kevin Cox

> unwilling to admit that fact.

They only know the specs by looking in the manuals at the Specification pages. I got the RS frequency counter a few months ago, it was defective. It displayed 000.0000 ALL the time even when beside a transmitter. So I took it back, and said that it was defective. Well, they take the back cover off, put some batteries in and voila!!! It works!!! The display (000.0000) comes on. The salesperson then said to me: "you put the batteries in the wrong way." I asked him if he knew what it was for, he said "counting frequencies", very good, how about trying to count a frequency now with it. Finally I told him to compare it with another counter to see the difference.

Do Life Guard helos usually share a frequency w/ the local EMS, or do they have a dedicated freq.?

3300. Re: UNIDEN WANTS TO KNOW...

Newsgroup: rec.radio.scanner
Date: 1996-02-09 00:00:00 UTC
From: hpeach@pop.uky.edu
Message-ID: <4fgddb$6tj@service2.uky.edu>
Source record: 240360
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I would like to see a scanner that had:

a) AM, FM, ACSB, possibly SSB, and a mode designed to allow computer interpretation of digital modes that use forms of phase modulation.
b) fully adjustable bandwidth.
c) an audio jack that is taken from before audio filtering takes place (for those who want to experiement with digital modes).
d) an IF out jack.
e) coverage from around 30MHz to 1.2GHz (including the traditional TV frequencies between 512-7xxMHz).
f) Ability to track APCO-25 trunking and digital audio
g) computer interface based on RS-232, Universal Serial Bus, or some other interface standard that is reaily available on desktops and notebooks.
h) All features of the scanner controllable from within software as well as the scanner's keypad (if it has/needs one).
i) A published manual detailing how to develop third party software to work with the box.
j) up conversion or some other technique to minimize images.
k) good selectivity, sensitivity, etc.
l) options available that allow the software to perform DSP functions to eliminate noise on signals, etc. and to perform demodulation of popular forms of digital information (e.g., POCSAG, Golay, CTCSS, PL TouchTone, ACARS, trunking data channels, Talkgroups, commercial and amateur packet, etc.) using soundblaster compatible sound cards.

As I thought about this, the actual radio box actually takes on a fairly minimal role in the future of scanning. I see it simply being a perpherial that feeds analog or digital data to a computer which then manipulates the feed into a usable form.

I'll probably get blasted for this, but you can reconfigure a standard, run of the mill TV antenna amplifier for the job. It should be good from 50Mhz out to 512Mhz at 10 Db of gain. Just be careful when using it in an area where you could inadvertantly pick up a strong signal. (receiver front end overload)

The impedance mismatch shouldn't hurt your sensitivity too much. The gain will overcome that. (unless you're using a couple of thousand feet of cable)

450.7250 is the STL (Studio to transmitter Link) frequency for KFI. If
you've ever listened to 450.7250FM and 640Khz AM simultaneously, you will
notice a 6-10 second delay in the audio so the radio station may censor
any unwanted transmissions (profanity from a live caller).

P.S. I think Mike Nolan KFI in the Sky uses 170.150 for his remote input.

Steve

3313. Pro-39 Help/Thanks

Message-ID: <311C31EB.255D@nando.net>
Source record: 240373

Just a thank you note to the person who helped me with my Pro-39's keypad problem. I would mention your name (I believe it's Todd) but my wife, the clean freak, through away my printout.

I was having trouble with non-working buttons on my Pro-39 keypad. I had taken it to Radio Shack to see if they could fix it. They told me that it would cost $120 for a new board to fix it (the scanner was $200). I told them to forget it. Then I saw Todd's message regarding replacing just the keypad which was about $5.00.

Well, I've installed the keypad tonight and the scanner works like a new one again! Shame, Shame, Shame (my best Gomer Pyle) on you Radio Shack for trying to dupe my out of $120. I hope anyone who reads this will ask for help here first and use Radio Sham as a last resort. I know I will.

Dave Ferguson

3317. Re: Houston Area Freq's

Newsgroup: rec.radio.scanner
Date: 1996-02-09 00:00:00 UTC
From: mike <Jholland@bayou.uh.edu>
Message-ID: <311B8C91.D13@bayou.uh.edu>
Source record: 240377

Here ya go!! The first # is the PL the second is the number you put in
your scanner and the third is the mobile freq.

Mike

I have fought with the same bull for the last few years. I have gone
from one insurance company to the next, and get a different reason why
they won't cover them. They will cover antenna'a and stereos, they will
also cover computers, but when it comes to 2-way radios they chicken
out. Same with radar-detectors and cellular phones.
There is a company that insures amateur radio equipment called Ham-Sure.
I don't have the address or phone number but I remember reading about
them in the back setion of ART (Amateur Radio Trader).

The cost is cheap, based upon the replacement values of your equipment,
and is a yearly charge.

Rob

Cross-posted to: alt.radio.scanner,rec.radio.scanner

How about a 16bit scanner card for the pc?

Think of it:

Receiver that covers: 25Mhz - 3 Ghz
Dual VFO's to make trunk busting easier.
Dual antenna inputs.

DSP chip for improved reception and/or decoding of pagers,
CTCSS, DTMF and other digital modes i.e. Packet..

Software that:
Allows infinate number of memories and automatic "programming"
of memories during active scanning. Plug-in filter additions for
DSP.
Automatic DATA Mode recognition.
Audio / RF Spectrum display.

The card should also have a demod output as well as audio. Should have
connector on card to interface with soundblaster or compatible.

Hehehe, just a thought.

3320. Antenna array

Hi Bill! Long time, no type! I got my new Diamond Discone atop 30'
of RS mast on my roof. Excellent reception from South Phoenix PD ground
units and marginal reception from handhelds at Sky Harbor. I've got it
going to my ICOM R7100 through a Grove Pre-5 with an Optoelectronics
Scout on the other output of the preamplifier. Eight guywires go to the 4
corners of the house and are insulated at each end with PVC crosses.

My HF longwire
is hanging from a boom just underneath the discone and is in an inverted "V"
to the ends of the roof peak. I strung an additional HF antenna in a loop
all the way around my house (under the eaves) and feed it to my Drake R8
with RG6.

Do you still do the Denny's thing once a month? I'd like to see see you there
again sometime. Which Wednesday night is it?

... ICOM R7100: the semiautomatic assault scanner!

They use regular marine VHF for the mostpart (too many freqs to list),
and HF Marine.
When my wife and I went on an Alaskan Cruise (Princess), I phoned the
radio room to ask for permission to operate my 2mtr rig from the deck
(1st mistake). I was told (in a hurry I might add) "Don't even turn it
on! For one, the power of our transmitter will fry your radio, and
secondly it will interfere with our navigational systems."

I know the power crap was just that, crap. And I have never heard of a
2mtr rig interfereing with navigational systems (other than on
aircraft), but be prepared to answer a lot of questions if one of the
crew see you with a handheld.

(I still operated, on low, and never received any complaints.)
Not very many repeaters available off the coast of Alaska.

Hmmm...

Can you site your source??? I think that you will find your statement is totaly false. I agree that employers should have the right to test, but letting your emotion (or rush to sound important) get the best of you and posting information that is not true and can not be backed up just makes you look foolish.

Actually, drug rehab costs aside, the largest portion of worker's comp is due to lack of employee training and the employee's goofing off (playing with something they know nothing about).

I solved the problem another way. For $5.00 I found a long-play data cassette player/recorder made by General Electric at a local thrift shop. It runs at about 1/2 normal speed, so it records 90+ minutes per side on a C-90, or 120+ minutes per side on a C-120!

Great for radio communications!

Electronic Communications Privacy Act, the federal law that tells you that it is illegal to listen to Cellular Telephone frequencies (among others), and makes it illegal to manufacture or import scanners and receivers that are easily modifiable to receive these forbidden frequencies.

800 MHz Virtual Downconverter for Scanners

Provides an easy and very effective way for newer models of 800 MHz capable scanners to receive the missing 869 to 894 MHz portion of the band. This technique is made possible by a modification that overrides the scanner's CPU, permitting manual activation of the 800 MHz receive band filter or receive converter circuit(s). Then, with the scanner programmed onto a non-800 MHz band, permitting the correct range of Local Oscillator carriers to be generated, perfect reception of the of the otherwise non-accessible 800 MHz band frequencies is achieved.

A detailed frequency conversion chart is provided to permit easy and accurate translation of the displayed frequencies to the "blocked" 800 MHz frequencies.

The Virtual Downconverter technique can be applied to about three fourths of all the 800 MHz capable scanners available. Some of these scanners include: Uniden -- BC-220, BC-860, BC-3000. BC-8500, BC-9000, and Radio Shack -- PRO-23, PRO-25, PRO-26, PRO-29, PRO-51, PRO2030 and PRO2040.

The Virtual Downconverter was developed by WA1YKL and is available from: Cellular Security Group, 47 Causeway Street, Gloucester, MA 01930. Call 508-281-8892 for more information.

I have a suggestion, that might sound a little backward. Decide what you want to hear, then go see if the frequencies are covered. I got a Undiden BC 120XLT in 1994, that does most everything I usually listen to (police, airport, marine). They should be about $ 150 or less now.

All of the manuals will list the frequencies. Just match them up and see what the trade-offs are.

I think you'll find most of the worthwhile scanners are made by Undien for Radio Shack. Why not go to the source? I have a 120XLT in my truck, and a 9000XLT at home. Better prices, and more knowledgeable people at Ham stores (such as Ham Radio Outlet). They have stores all over. Let me know the nearest big city, and I give you an 800 number.

The current issue of MT has a brief article in which the writer compares the two scanners side by side. You're essentially correct in your observations about convenience features and enhanced search functions.

I recently purchased a 2042 for $440 with shipping, from Ft Worth. The scanner was $420--they stiff you with an inflated shipping and handling charge. The 2035 is being sold in several places for about $375-$380 (it may be selling for less than that by some mail order places, but I didn't check terribly hard because I knew that I wanted the 2042 regardless). For me, I felt the price difference was worth it, if no other reason that in the long run, the 2042 would hold it's resale value better. I installed the Optoscan 535 and am just now putting the scanner through its paces.

How do you PROVE use if you don't have a testing mechanism. In these days of high-dollar, wrongful-dismissal lawsuits, "suspected drug use" is not sufficient grounds for termination of employment. You need proof. Especially if the suspected user is female, or (worse) a member of a minority group. These people will jump up and claim "discrimination" any chance they get. Without conclusive evidence, you become the victim.

(snip)

>Now, should a person take recreational drugs? Personally, I think they are

Is it also a "personal choice" to run red lights, drive on the highway at 100MPH, or assault people with semi-automatic weapons? Of course not! All these acts are illegal...as is the possession and use of "recreational drugs."

Hi there. I am in Vancouver and have recently found that when I scan through the freqs below 880 (cantel) the voices seem to be much more distorted than they seemed about a week ago. Anybody else notice this? Any possible explanations? The distortion seems to sound like the channel is being put through a "phlanger" or some sort of compressor.

3338. Beta Testers Wanted: CE-232 Software

Newsgroup: rec.radio.scanner
Date: 1996-02-09 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <4ff774$s90@news2.cts.com>
Source record: 240426
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Wanted: Beta Testers

For a powerful, new operating program for the CE-232 or HB-232
Scanner/Computer Interface.

Qualifications required:

1. Must be a registered/original owner of a CE-232 or HB-232
Scanner/Computer Interface operating with one of the following
three scanners: PRO-2004, PRO-2005, or PRO-2006

2. Must be able to read and follow written English instructions.

5. Must have e-mail capability and use it to make regular reports
and to get technical support on a timely basis.

6. Must perform the beta test work and regularly report results.

7. Must be age 18 or older.

8. Must have a "beta tester's attitude"; i.e., be adventuresome,
persistent, innovative, ingenious, and a little crazy.

Other information
=================

Approximately 5 beta testers are needed to test a new operating
program for the CE-232 or HB-232 Interface.

If interested in participating in this beta test, send e-mail to:

bcheek@cts.com

and briefly describe your skills, abilities, and capabilities to
perform the work. There may or may not be a nominal, non-refundable
charge for the beta materials. Do NOT apply if you do not have a
CE-232 or HB-232 Interface and one of the three mentioned scanners.

I will reply to serious applicants with a detailed explanation of the
beta test, and what is expected of the beta testers.

The beta test will be conducted exclusively by e-mail. Technical
support by e-mail, will be provided on a timely basis.

The CE-232 beta test is not expected to be iminent, so patience is
required of those who apply.

>Winston (Kd2ej)

On the bottom of the Pro-2026, locate the Control PC Board (the one with all of the wire connections on it behind the display). If yours has a small wire loop labeled L201 (center-rear of the board), cut this to restore full 800Mhz coverage.

Identify the J4 wire bundle (8 conductors). If you cut pin (or wire) 5, this will disable the beep signal from reaching the audio amplifier (so if you hear it at all, it will be VERY quiet.

Radio Shack is a great place to get a wide variety of useful electronic parts and devices. If you know what you are doing, and know what you want, then you will do fine. Do yourself a favor, do your own homework (ask expert friends, hang out around here, read current communications-oriented publications and books, and get a Radio Shack Catalog for home reference and planning).

Use the 'Shack as a parts warehouse, and forget about expecting experts behind the cash register. I have heard some of the biggest lies and FUNNIEST descriptions from these people that I refuse to consult them at all.

I haven't burned myself yet, and I'll be damned if I am going to give one of these guys the opportunity to do it to me!

Steve

3342. Trade Pro-2006 for IC-R1

Newsgroup: rec.radio.scanner

I would like to trade my PRO-2006 for an Icom R-1. Must have 800, must be in good shape, and I would prefer to have the BC-72 quick charger with either BP-83 or BP-84 batteries.

Thanks,

Nate.

http://www.uwm.edu/~herb

PS: To all Icom R-1 flamers, I have owned one, and I like it. I agree, It is not perfect, but it is good for what I use them for.

800 MHz Virtual Downconverter for Scanners

Provides an easy and very effective way for newer models of 800 MHz capable scanners to receive the missing 869 to 894 MHz portion of the band. This technique is made possible by a modification that overrides the scanner's CPU, permitting manual activation of the 800 MHz receive band filter or receive converter circuit(s). Then, with the scanner programmed onto a non-800 MHz band, permitting the correct range of Local Oscillator carriers to be generated, perfect reception of the of the otherwise non-accessible 800 MHz band frequencies is achieved.

A detailed frequency conversion chart is provided to permit easy and accurate translation of the displayed frequencies to the "blocked" 800 MHz frequencies.

The Virtual Downconverter technique can be applied to about three fourths of all the 800 MHz capable scanners available. Some of these scanners include: Uniden -- BC-220, BC-860, BC-3000. BC-8500, BC-9000, and Radio Shack -- PRO-23, PRO-25, PRO-26, PRO-29, PRO-51, PRO2030 and PRO2040.

The Virtual Downconverter was developed by WA1YKL and is available from: Cellular Security Group, 47 Causeway Street, Gloucester, MA 01930. Call 508-281-8892 for more information.

Hi John,

are you sure it's 151.570? (151.565 is allocated to Special Industrial)

If you meant 154.570 then the repeater frequency (customer) should be
on 30.840.

Bob

Get a Radio Shaq Frequency Counter!
They work just fine... They have two gate speeds, and you set it to look for 1-50Mhz or 50-1600Mhz. It has a light and you can easily upgrade the antenna.
I have been using it for a while now... It kicks ass.

From: JeffC@gnn.com
Message-ID: <4fjmd7$2f1@news-e1a.megaweb.com>
Source record: 240241

Is there any way to adapt the AEA WEFAX software so ACARS is readable? I think the ACARS is FSK at 9600 baud...

While I'm at it... I'd like to hear from anybody who has modified the AEA programming to extend it's capabilities. Am I right in assuming that additional programming is a limitation or is it strictly hardware (demodulator, etc.) related.

Thanks,
Jeff

3355. Muzak music on 900Mhz

Newsgroup: rec.radio.scanner
Date: 1996-02-10 00:00:00 UTC
From: anon1723@nyx10.cs.du.edu
Message-ID: <4fjrsd$onh@nyx10.cs.du.edu>
Source record: 240243

I remember a post a few months back about someone claiming to have received channels carrying Muzak (commerical-free light pop-rock music and/or elevator music) on 900Mhz. Specifically, the frequencies mentioned were 928.9125 and 956.3125. All I get on these is data transmissions. Are the above freqs licensed to Muzak (or whoever) on a nationwide basis or just in certain locations? Has anyone received music on these frequencies and if so where are you located?

Also, in general, how do you look up who frequencies are allocated to in the 900 Mhz band? Is there anything online where you can look up someone by name and find what frequency they are allocated to? Or books? I looked in the Radio Shack guide and they have very little listed in the 900Mhz band.

3359. AR8000 narrow I.F. filter mod

Newsgroup: rec.radio.scanner
Date: 1996-02-10 00:00:00 UTC
From: klimasewski@fccvde.enet.dec.com
Message-ID: <4fj7cv$4kc@mrnews.mro.dec.com>
Source record: 240247

I have designed a switching scheme that allows the user to select
the stock 12KHz AM filter or the narrow SSB 4.0KHz while still in
the AM mode. I have found this to make a BIG difference when trying
to receive a weak shortwave station next to a very strong one.
The only part required is a switch and some wire.
My mod has no effect on the use of the DS8000 speech inversion accessory.

Send me email if interested.

Ken

3362. Kits for band translators

Newsgroup: rec.radio.scanner
Date: 1996-02-10 00:00:00 UTC
From: anon1723@nyx10.cs.du.edu
Message-ID: <4fjshl$qgf@nyx10.cs.du.edu>
Source record: 240250

I remember reading an article in R&E in 1992 about a band translator which would translate the 800-1000Mhz band down by 300Mhz so you could pick it up on 500-700 on your scanner. Included in the article was a supplier who would provide the board for about $20, and full set of parts for $70. Any chance this would still be available? Does anyone know how long they generally keep the kits for these magazine projects for sale? Or just the boards?

Also, are there more recent articles on these devices where you would be more likely to be able to get a parts kit. Or other places where kits would be available?

I don't like the $3 catalog business either, it's a nuisance for the sales people also. However, addressing the above, the $3 dollar rebate on a subsequent sale is pre-tax, so that the total sale is reduced $3 plus tax. If you live in an area like mine where small communities have different tax rates, you can actually make a nickel or so on the deal (Wow, Ren, a WHOLE nickel!!!).

Not necessarily true. I have seen 6 or so Pro-2026 scanners in the "A" packaging that had 11A3 date codes and were restorable via cutting L201 as normal! Radio Shack is inconsistent, if nothing else.

Steve

3368. FS: Yupiteru MVT 8000 (price reduced)

Newsgroup: rec.radio.scanner
Date: 1996-02-10 00:00:00 UTC
From: lmilrad@passport.ca
Message-ID: <4fi77c$j3t@diplomatic.passport.ca>
Source record: 240293
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Price is now $450.00 US plus shipping.

The MVT 8000 is 200 channel ac/dc scanner with a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired.
It covers 8 Mhz to 1300 Mhz (continuous without blockage) and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz.

It's got a 10 band search function, pass memory function, and other goodies found in high-end scanners.

3369. Flashing mode indicator on PRO-43

Newsgroup: rec.radio.scanner
Date: 1996-02-10 00:00:00 UTC
From: jknight@chattanooga.net
Message-ID: <4fhatf$5nk@news.chattanooga.net>
Source record: 240294

I programmed a search range into my PRO-43 and used a non-standard mode.
(FM in the 225-400 MhZ range)
Now, when I program a search, the default mode is still selected, but the
mode indicator flashes. This is just a minor annoyance, but does anyone
know a way to stop the flashing? A master reset will work (I tried it)
but does anyone know another method?

3370. FS Grove FCC Database $50

>What is the differents between these two scanners? Is the 9000 worth $95.00 more, and why?
>Do both have cell mods?

>Thanks,
>SBacker@vivanet.com

A catalog I received from "Scannerworld" (a mail-order outfit)
yesterday said that the BC-9000 is "this year's model" of the BC-8500
(which the catalog says is "last year's model) and that they are the
same radio with the same specs. And yes, Scannerworld had both radios
shown, with the BC-9000 listed at about $100 more than than the
BC-8500.

VHF frequencies fall between 30 and 300 MHz.
UHF frequencies fall between 300 and 3000 MHz.

You'll find almost all services have allocations on both bands. In
citiies, in general, it seems that UHF is more popular with police,
with fire departments popping up on either (or both) bands. In
Dallas, for example, city police are on UHF, with fire dispatch on
UHF, mobiles & handhelds on VHF. Of course, with trunking becoming
more popular, 800 MHz (another chunk in the UHF band) seems to be the
most desired neighborhood these days for public service agencies.

In the scanner world, the VHF band is "split" in two, with VHF-low
frequencies between 30 and 50 MHz, and VHF-high between 136 (or so)
and 174 MHz. I doubt that your HT will pick up anything below 135-140
MHz or so, unless it covers VHF aircraft (108-136 MHz).

As far as frequencies for your area, check out the following web site:

http://www.cs.nmsu.edu:80/~tharrel/scanner/scanner.html

Hope this helps.

Message-ID: <4fgtor$h73@floyd.santarosa.edu>
Source record: 240301

Hi,

I have heard my local Taco Bell on 151.570 (I think).. It is one of those "dot" business band frequencies. Anyway.. I only here the store employee on that frequency; I can not here the customer ordering. Is there some sort of offset that is used (like a repeater)? Or is it that the person ordering is connected directly to the inside of the restaurant, while the employee is the only one that is on a radio? If you can help me with this puzzling little problem please e-mail me.

Thanks,

John
jthompso@santarosa.edu

>well!

Receiving "image frequencies" works quite well, too, in lesser
scanners. The "virtual downconverter", though it works as you
described, produces results precisely like you'd get by tuning to
images. That is, the displayed frequency is not the same as the
target frequency, and there is a tradeoff (loss) of performance to a
minor extent.

All that said and done, the "virtual downconverter" is the ONLY way to
retrieve cellular frequencies from the PRO-2035/2042 and many other
scanners aside from replacing the Logic/CPU board with a Euro version.

>Can you explain what 'up-conversion' is?
> I presume it's the
>relation of the LO freq to the 1st IF freq, but which way
>is 'up'?

Strictly speaking, up conversion means the 1st IF is higher
than the frequency to which the receiver is tuned.
Truth be told, this condition holds for only part of the
spectrum covered by the PRO-2037, since the 2037 covers
freqs up to the GHz range, well above its 257.5 MHz IF.

In the context of discussing scanners, using the term "up conversion"
loosely differentiates the 2037 from simpler models with 1st IFs in
the 10.7 - 10.8 MHz range (down conversion).

> If I'm tuned to say 161.475 on the 2037, with an IF of
>257.5, what's the LO tuned to?

The LO would either be tuned to 418.975 (sum of IF plus
programmed freq) or 96.025 MHz (difference).
While I don't have the PRO-2037 documentation in front of me,
I'd guess the PRO-2037 LO would be tuned to the sum in
this case.

Experimenter's tip:
You might resolve this ambiguity yourself
by listening on 96.025 MHz in a nearby FM broadcast
receiver while your 2037 is programmed for 161.475 MHz.
The signals radiated by receiver local oscillators are usually
strong enough to hear in neighboring receivers.

arizonman@aol.com (ArizonMan) wrote:

>what does a tone board do?

The tone-board for the Bearcat BC-760xlt allows you to select CTCSS tones for various operations... What the whole idea behind the tones in the first place is, MOST public safety, businesses etc. use CTCSS tones, which Close the Squelch of their radios, so that if there are multiple users on one frequency thay won't HEAR no one else but their own people, who use the same TONES, scanners as thay are setup will monitor ALL traffic on a freqency, no matter who your intended party was going to be, this is the case when "Atmospheric ducting" known as SKIP comes in and begins putting unwanted traffic on a channel thats intended for someone else.. With this TONE BOARD installed you can program the proper tone for whatever department it is you wish to monitor along with their freqency, so now, intead of being forced to hear EVERYTHING on a channel, you will only hear traffic when someone with the proper TONE is sent out with the transmission, this will open your scanner's squelch and there you go, you will catch the important traffic.. BTW, these tones are sub-aubible meaning the tones are going out whenever someone keys their mike, but you will not know it because you won't hear the tones... Does this help any, or did I just confuse you even more??? My suguestion is to goto a local electonics store, look for books concerning radio communications, librarys should have info too...

Please provide some documentation for this claim. As far as I have been able to find out, there are very few automobile accidents due to users of illegal drugs - most are due to drunk drivers.

I think anyone who is impaired while driving, for ANY reason (not just legal or illegal drug usage) should be cited and locked up.

As far as on the job impairment, impairment testing is the answer. It would test for ACTUAL danger to others, not just because someone had smoked some marijuana at a party 3 weeks previously.

This is incorrect. Even with a transmitter, the mismatch is perfectly acceptable, it would only be 1.5:1 - and slight losses due to the VSWR is going to be slight, compared to the plain attenuation losses of the coax.

>everything in their catalog. Yikes! Oh, well. Thanks for the bandwidth.
>
>

I'm not affiliated with Shack in any way, but I think your last paragraph hits a point. We'd all be poorer without the stores, especially people in those smaller communities. In fact, I'd say fortunately Radio SHack is the only place to go... where would they go if there was no Shack.

As a mass-market, mall or strip based shop, it's obvious they don't directly target the keen hobbyist. So what?

Despite all the frustrations I've had with shops in all different hobby areas I've been involved in, I'm glad they're here. They help keep the hobbies alive. The world would be a little poorer without them. And finally, if I didn't like a particular store, I simply wouldn't patronize it, I sure wouldn't get all mad.

I'm not an insurance expert but I can't fathom why a scanner would not be covered like any other appliance. In any case, you're better off getting a high deductible, like $1000, and paying a lower premium, rather than the a low deductible and a high premium. You'll make out better in the long run. You'll pay less money, enough to cover the cost of most scanners, and the insurance company will grant you the "privelege" of renewing your policy every year. The fact is, if you had had, say a $200 deductible and submitted a claim you would have gotten back $100-$150 (the value of the radio, minus the deductible). The insurance company would have raised your rate or would not have renewed at all. Also, check to see what the premium is for $1000 deductible compared to a $200 deductible. I'll guess that it is $100-$150 per year.

I have had the 890 for a few months now and have heard/seen 2
conflicting things about it and was hoping someone could help me get it
straight.

1. I was told by the person who sold it to me that it does not pick up
Military frequencies but seen something on the Internet that does.
Does it?

I am really looking forward to the Air & Water Show and was wondering
if I would be able to listen in to the Military aircraft, has anyone
ever done this?

2. I have read articles in the scanner newsgroups indicating you could
nto modify it but seen a book in a catalog indicating you could.
Can it be modified? Don't know if I want to but it would be nice to
know I have the option.

Thanks

>WOuld this be the unit for me?

It could be. The PRO-2004 is possibly the finest scanner ever made
for mass distribution channels. A few are dogs. I think $145 is a
bit steep, but if the scanner is clean, with a nice bright backlight.
it could be in the ballpark.

A few PRO-2004's were dogs. The wave soldering machine and possibly
the parts stuffing machine at the factory slowly drifted out of
tolerance, and before defects started showing up in QA, hundreds were
shipped that proved trouble prone later. Defective solder joints;
and incompletely stuffed parts were the problem, but only the worst
showed up right away and were caught in warrant. Then more showed
up after warranty expired. There have been several waves of this
problem coming to light since 1986 when the 2004 was introduced.
I am hearing more reports now, and I have one PRO-2004 on my bench
undergoing evaluation.

Problems appear as intermittent for starters. Sometimes, the unit
works fine until it warms up and then something "fails". Perhaps
the display will blank; perhaps receive will fade; any number of
symptoms could be apparent. It all depends on where the defective
or degrading solder joint(s) are located.

There's not much you can do aside from running the unit for several
hours. If possible, do that and lay a cloth over the top case so
the scanner can get warm. Any latent problems may show up at that
time.

Another thing you can do is remove the metal case and study the
components on the main board. (Remove the speaker, too.) Look
at all the components, especially the "greenish" colored capacitors.
If they are not "stuffed" all the way into the board, there could
be problems later. Stuffed parts should not have much, if any, of
the wire-leads showing above the board.

CLOSING NOTES: The PRO-2004, PRO-2005, and PRO-2006 are all
fundamentally the same scanner, with only a tiny bit of electronic
evolution from one model to the next:

PRO-2004: 1986-1989
PRO-2005: 1989-1990

PRO-2006: 1990-1995

The PRO-2004 can be brought up to PRO-2006 electronic standards
by the astute hacker. It retains the strong advantages of the
tactile, sloping front panel; larger LCD Display; solid metal
(shielded) cabinet; and plenty of working room inside the
scanner for mods, hacks, and add-ons. The PRO-2005 and 2006
have plastic cases with a straight face panel and tiny keys.
The PRO-2005 is electrically almost the same as the 2004, so
the 2004 is much the better deal for the most part.

The PRO-2006 suffers from the plastic case and icky front
panel design, but is electronically somewhat advanced over
the PRO-2004/5. It is also newer, and there are no known
production-line problems with it. The 2006 may be the
better deal if you can find one.

Also in the PRO-2004 "family" are the PRO-2035 and PRO-2042.

PRO-2035: 1995-1996
PRO-2042: 1996-

But these have cellular deliberately removed and their
evolution over the PRO-2004/5/6 is largely "firmware" and
not so much hardware. The front panels are utterly terrible
in terms of efficient working of the keyboards.

But there you have it in a nutshell. Which one is right?
I'd be mighty tempted on the 2004 if it were clean and
fully functional, but that $145 is a bit steep. $75 to
$100 is more of a target to shoot for if the seller will dicker.
After all, it is 7-10 years old now....and there is a problem
history associated with the PRO-2004. Yet all in all, it
remains my favored scanner of all time.

>receive this paging pretty strongly, but I am hoping that
>there is some magic out there!

There is no magic. Antennas are a lot like filters in electrical characteristics and analysis, but we've yet to come up with an antenna that resembles a notch filter. On the other hand, it is old hat to design an antenna like a bandpass filter....that is, an antenna cut for a frequency and adjacent bands (and harmonics) of interest.

There is no way of making an antenna reject one frequency and to accept all others. Your notch filter remains the sole viable option there, UNLESS.....you want to consider a directional beam antenna like a log-periodic or even a TV antenna mounted in the vertical plane.

The rejection lobes or "nulls" of a directional beam antenna can be positioned in the same azimuth as an offending pager, thereby decreasing its strength by an order of 6 to 40 dB, depending on the type and quality of the antenna.

Rgds,

From: zant0001@gold.tc.umn.edu
Message-ID: <zant0001.823970098@gold.tc.umn.edu>
Source record: 240324

I'm interested in investing a fair amount of money into a handheld scanner, and have been looking through magazines, visiting local trade shows, etc.. but I'm still not coming up with much. From what I've read, and have seen so far, The widest coverage handhelds I'm willing to shell out money for are the Pro-26 and Bearcat 3000XLT. I'm also interested in getting shortwave coverage, and would consider something like the AR8000, but only if it's worth it.

I know this has probably been asked a thousand and one times on here, but I need some non-salesman feedback.

Thanks,

Eric

From: mulligan@ACM.ORG
Message-ID: <4fipii$95m@hopper.acm.org>
Source record: 240327

rdr@efn.org (Robert Robertson) asked:

> ... if it's on the VHF or UHF band ...
> Are there any "guidelines" to follow??

If you're asking what are the definitions of the ranges of the radio spectrum, the bands are defined as:

Very Low Freq VLF 3 - 30 kHz
Low Freq LF 30 - 300 kHz
Medium Freq MF 300 - 3000 kHz
High Freq HF 3 - 30 MHz
Very High Freq VHF 30 - 300 MHz
Ultra High Freq UHF 300 - 3000 MHz
Super High Freq SHF 3 - 30 GHz
Extremely High Freq EHF 30 - 300 GHz

If you want to know what services are allocated in the U.S. to what frequencies, download:

ftp://oak.oakland.edu /pub/hamradio/docs/misc/ fcc.allocations
CompuServe HamNet Forum Lib 2 FCCTBL.TXT

FCC Frequency Table Summary -
A summary of the FCC Table of Frequency Allocations for the 30 - 1300 MHz range. Since it boils 90 pages of data down to 160 lines, a little detail has been lost <g>, but it will guide a scanner user to what's where.

My list for the perfect handheld would include:

- 200 channels in 10 groups
- standard RF coverage and specs as today's top of the line models
- Alpha/numeric display
- similar to Garmin GPS45 (64x100pixels)
- display would have: Band #, Band Name (12char), Channel Name (12 char), Channel frequency, status(lockout & delay & number of hits since entered)
- full numeric keyboard
- up/down/left/right toggle switch for alpha char entry (again similar to Garmin 45
- RS232 like interface (no need to be 12 volt swing)
- Optional SW package to allow full range of data manipulation and up/down load

Message-ID: <4fl376$ck1@hopper.acm.org>
Source record: 240187

The allocation comes under the "Private Operational-Fixed Microwave" service as "Multiple Address Systems". They're unlikely to be listed in scanner guides, which are more concerned with Land Mobile licencees, but you might try the Percom web site, which has a search engine for its license database products. Both Percom and Grove publish CDs with fairly complete extracts from the FCC Master File.

The frequencies in question are 928-929 MHz and 952-960 MHz. The bands are shared with other multi-address systems, such as alarm monitors and remote data acquisition systems, so finding intermitant digital bursts is to be expected. In Atlanta, the local Muzak affiliate uses 956.3375 and 959.8875 MHz. These are the nominal center frequencies; assigned bandwidth can range from 12.5 to 200 kHz, depending on the type of transmission. Power is limited and the master site may use directional antennas, so you may not hear a system even if it's operating in your area.

Source record: 240188

Any one interested in a WINDOWS program to modify the EEPROM contents in the AR8000?

I have written one and am considering giving it away once it is working rather reliably. I have already done numerous memory dumps, mods, and reloads with it and it works, but I am trying to make it cleaner and better.

Just wanted to test the waters. Most packages that do this cost a lot of money and do full computer-control of your scanner. That's overkill if all you want to do is modify the memory contents.

>batteries in the wrong way." I asked him if he knew what it was for, he
>said "counting frequencies", very good, how about trying to count a
>frequency now with it. Finally I told him to compare it with another
>counter to see the difference.

Instant termination - if you don't know ask!!

I am surprised that they are still in busines - I hardly ever go to RS
anymore - and NEVER trust that Korean/Taiwan/Orient built
crap that sell - it always breaks! (at least the scanners are made by
Uniden and some of the computers are AST and IBM)

I stay very far away from the "counter help"
"you need a transistor? Umm... is that the one with 2 wires or 3?"

In all fairness, not all RS employees are slugs, just most of 'em.
:)

I went to a store to get an audio adapter for my HT (mini to 1/4")
I had to fight off the kids with the RC cars on the floor and
bother the employee to tear himself away from the game he was playing
(demo to a 'customer') to settle my bill.

It's getting worse every year - But I do remember 15-20 years ago, it
used to be THE BEST place to get components and some help.
Many radio projects were completed due to RS.
The tube tester was great!

Time changes things, but it can be better.

G > It looks like the possible replacements are the Pro60 and the
G > Pro26. Anyone out there who owns one of these and would care to
G > comment on their likes/dislikes. Which would you buy?

I don't know about the Pro-60, but I've got a Pro-26 and really
like it (it's on sale right now for $399.- Canadian at Radio Shack).

With my own unit, sensitivity over the whole 25-1300 MHz range is
at par with most other scanners, exceptions being around 120 MHz,
which seems below average, while the entire 800 MHz band seems
noticeably ABOVE average. Image rejection is no better compared to
other (portable) scanners, despite the triple conversion, and is
probably due to the crammed circuitry. Even though it's a small
scanner, there is lots of room inside for possible modifications.

G > Yeah...I know you can't get cellular reception on these models.

I've come up with a mod that allows the Pro-26 to receive or search
ALL locked-out frequencies with full sensitivity! It only requires
one jumper across an IC chip - no other parts - so just about anyone
with "soldering iron skills" should be able to do it. (the usual
warranty/disclaimers apply).
I've got detailed instructions with diagrams on how to do the above,
including a mod for the backlight to stay on and not go off after 15
seconds. The backlight mod requires a couple of parts though, and is
a bit more involved (one has to solder to tiny surface mount parts).

Anyone interested can send me their (printed!) address, $4.00, and a
first class stamp to:
R. Roth
P.O. Box 81027
Ancaster, Ont. Canada
L9G 4X1

I have previously uploaded schematics for some of these mods, but
I'm getting tired using usenet-conforming characters to piece these
diagrams together.

I highly doubt a lawsuit is in order. What is your deductable? Is it less than what a new scanner would cost?

In your policy I bet that you will find that "portable" electronic devices fall under automotive. Cell phones, scanners, ham radios, pagers, boom boxes, laptop computers, and whatever else you can take with you. Thats very common, I am suprised you did not know this.

I am a Reading native, although am in Michigan now. Was
back for a visit a few months ago and can add the
following to the other person's posting:
One of the Reading 800 mhz frequencies was dedicated to
phone patches at the time. Don't remember which one. Also,
the old fire dispatch , 154.43 was active with BASE STATION
TRAFFIC ONLY. Was kinda nice to not miss any of the fire
calls go out. You might also try out some of the other
freqs around 33.94 for secondary fire traffic. I seem to
remember 33.90 in use along with a few others. Be aware
though that some neighboring counties also use these
other freqs. Also try 155.280 ("280") and 155.340 ("340")
for other EMS ambulance to hospital traffic.

>: being purchased by $3 on the sales slip _before_ taxes are computed; which
>: means that any sales tax which you paid on the catalog is deducted from
>: the price of the item along with the $3.
>
>
>: Greg

Kudo's to Greg for pointing this out. It's scary how many customers
I had dealt with who had difficulty with this concept.

As to the reply regarding using the coupon in a locale with less sales
tax than where you bought the damn thing, the reverse is true if you use it
where the sales tax is higher than where you bought it. So that means:
YOU WIN!!!

Although I thought it was a bone-head idea when they started charging
for the catalog, I think I would rather spend my less than 1 cent a day to
have the damn thing than to agonize over it.

In a previous article, tomuser@aol.com (Tom user) says:

>No problem with your A8000. Under new law, every scanner which is covering
>also the regular FM radio frequencies, is legal. It`s just unlegal to hear
>for example police, fire brigade, phones etc. Have a nice trip

From what I know, all radio equipment in Germany has to have its
own German Post (FCC equivalent) number. So technically, even though you
can receive the regular FM frequencies, you're American licensed AR8000 is
not 100% legal. My recommendation, take it with you, keep it out of sight
though. And put it in your luggage, because I have read many times that
airport security in Germany has given people with scanners a hard time.

How about personality cloning via a data cable, in addition to computer control, on the same RS-232 port? Or better yet, a personality card, that can be moved from scanner to scanner to copy freq assignments, etc. Often, a station has multiple scanners. Its a pain to program all of them to be the same by hand...
A card like his would have to hold quite a bit of data, and so would probably be cost prohibitive - for a while. A simple clone function would be great...

If you monitor frequencies on which multiple agencies transmit - then
it's worth it. Basically CTCSS is a sub-audible tone of a specific
frequency transmitted whenever the transmitter is keyed. If you have
the option installed you can listen to desired transmissions while not
being disturbed by others.

I have been on Compuserve for a year or so, and the top of the line, best handheld discussed there is the AR 8000. They all seem to buy through Javiation in the UK. The price is better, and there are no frequency gaps as in the US.

The mod definitly works, the only thing is that it scans in 25khz steps and the spacing for cell phones is 30 khz, therefore some channels will be off frequenc and some will be skipped over.....other wise, it's still a worthwhile mod to make.

> In my (so far unsuccesful) search for cellular images,
> I'm wondering if anyone can tell me the 9000's IF?

For the Uniden/Bearcat BC9000XLT:

1st IF = 254.4 or 380.7 MHz (depends on band)
2nd IF = 58.075 MHz
3rd IF = 5.5 or 0.455 MHz (depends on mode)

3460. Cell images, PRO2035, 1100-1115Mhz

Newsgroup: rec.radio.scanner
Date: 1996-02-11 00:00:00 UTC
From: anon1723@nyx10.cs.du.edu
Message-ID: <4flhf8$4s2@nyx10.cs.du.edu>
Source record: 240281

I have been playing around with a PRO2035 and have noticed what appears to be cell phone conversations. Needless to say, the unit is blocked at the normal cell phone freqs.

The conversations are appearing ONLY between 1100 and 1115. On this model, the two IF's are 612Mhz and 48Mhz. I am having difficulty figuring out what is going on here. I would expect that if translation were to occur, it would be at either 1/2 or 1/3 of the first IF, i.e. 306 or 204 Mhz. The mechanism of the translation would be the second or third harmonic of the difference between the cell signal (i.e. 820Mhz), and the local oscillator (i.e. 1110-612=498Mhz) being demodulated. However, I cannot explain this phenomenon because shifting the 1110-1115 band by either 204 or 306 does not match any cell phone band. Can someone explain if 1) these are really images of cell calls and 2) by what mechanism are the frequencies being translated.

I would guess that I am operating the receiver near a cell site of one of the two cell providers in this area. This would explain why there is only 15Mhz of bandwidth since half the spectrum is allocated to each carrier. However if this were the case, why would some signals be strong (very clearly intelligible) and some weak? If all the signals were coming from the same cell site I would expect them to be all the same strength.

Or are there true frequencies broadcast in 1100-1115 which are some sort of personal communcations device, and the scanner makers not yet mandated to block these freqs? The signals sound suspiciously like phone conversations with rings, busy signals, automobile-type noises in the background, etc. The also abruptly disappear with an average life of about 20-30 seconds.

There seems to be no mention of image rejection in the specs on this radio. They do mention "IF rejection" a useless spec since it only involves a couple of frequencies.

Assuming these are really cell calls, is the next step the FCC is going to take is to mandate a minimum image-rejection spec?

I'm looking for specific on San Bernardino County's West End 800 trunking fire system.

Does anyone have information on the
1) Control Channels
2) Connect Tone
3) Subfleets

I have the ability to read an STX, if anyone knows a fireman who is willing...

I'm willing to trade info on other systems

I know that they are Motorola Type II and that Ontario, Montclair and Chino are on the shared system.

Any information would be graetly appreciated...

Thanks

3466. ACARS (mis)information

Newsgroup: rec.radio.scanner
Date: 1996-02-12 00:00:00 UTC
From: Dale Dickerhoof <daled@xetron.com>
Message-ID: <DMoBqw.1L5@xetron.com>
Source record: 240091

I have seen several posts to this newsgroup, and I have received some e-mail correspondence regarding the ACARS signal characteristics. I don't think that I have seen the same information from any two sources.

I have been told that the signal is PSK, MSK, FSK, and Manchester-encoded AM. I have seen references to 1200, 2400, and now 9600 bps. The only commonality is that AM is used to transmit the modulated signal.

I think it would be a great service to this group if someone could authoritatively state (citing the reference material) the data rate and its precise method of modulation. Perhaps someone with access to the original ARINC spec. is listening?

INTRODUCING HAM RADIO ONLINE INTERACTIVE!
Now you can post free classified ads, DX openings, VHF band openings
and much more. And with over 10,000 readers stopping by last month,
your thoughts will actually get read at this ham radio web site! We are not
just pointers to cyberspace - we've got actual content - feature articles,
newsletters, product reviews, real-time propagation conditions and more.

The February 1996 edition of Ham Radio Online International Magazine
is available at http://www.accessone.com/~vbook/hronline.htm

Some of the NEW February stories include a review of SkyTel's "2-way paging" system,
radio surveillance frequencies, and the effects of two-way radio operation in blasting
zones.

Ham Radio Online has been selected as a featured web site by America Online
and a Top 100 web site for the month of January by Planet Earth, Inc.
New articles are available now and we add articles throughout the month.

Ham Radio Online has up-to-date news about Amateur Radio from around the world,
feature stories, real-time propagation and auroral condition reports, real-time
earthquake and severe weather conditions for emergency communications planning,
online humor section and the Ham Radio Online Library with fully indexed (find
any section with just a mouse click) Part 97 rules and regulations.

Plus we cover broadcasting, shortwave, scanning generally anything having to
do with radio telecommunications.

And we plan to offer some totally cool new services during the coming months. As
always its free and free of ads.

Thanks to you, we had over 10,000 readers stop by during January!

Please enjoy!

73, Ed Mitchell

3477. AR8000 database program

Newsgroup: rec.radio.scanner
Date: 1996-02-12 00:00:00 UTC
From: Jim Dantin <Jadantin@uky.campus.mci.net>
Message-ID: <311FE47D.61D@uky.campus.mci.net>
Source record: 240102
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Thanks to Robert McKenzie for posting my AR8000 database program on his ftp site. The file can be found at:

ftp.rpmdp.com/pub/ar8000/ar8000-2.zip

This is a Microsoft Access 2 database application that assists you in maintaining a master frequency list and maintaining your channel assignments in the AR8000. It does not directly communicate with the radio (it generates a text file that you send to the radio with Terminal or some other communications program). I have included a formatted report that lists the AR8000's memory channels on four 8.5x11 sheets.

This database is FREEWARE.

I am currently modifying it to add the capability to specify step offsets, clear a bank or the entire channel assignment, and thanks to the help of some other interested users, may add direct communications.

This version is in Access 2, but future versions will probably be in Access for Windows 95 Version 7. ALL future versions will stay freeware - all I ask is for your comments and suggestions. Have fun!

Dale, have a look at :
http://www.u-net.com/~morfis/acarstec.htm

That is taken from the relevant ARINC spec.
"ARINC Data Link Ground System Standard and Interface Specifications
(DGSS/IS) 620-1" Also see "ARINC Characteristic 597"
These publications are available to the public in the US but they are
expensive.

Here are the results of my independent investigations.

I do not speak for DSC.

Concerning the Uniden Bearcat 855 XLT scanner:

Summary:

Two useful keyboard hacks are described. One loads test frequencies, the other resets all channels.

By making hardware modifications, four different independently performable modifications to behavior are possible. Each can be done by cutting and redirecting a jumper. Soldering is required. The four modifications are

(1) doubling the number of channels from 50 to 100,
(2) unblocking cellular,
(3) replacing the 29-54 MHz band with a mediocre 66-88 MHz band,
(4) completely blocking 806-960 MHz.

Doing any of these modifications results in loss of all programmed frequencies and scan limits.

Background:

According to Marc Saxon in "Scanner Scene" in Popular Electronics, November, 1995 the BC-200XLT, BC-205XLT, and BC-950XLT are all modifiable. The BC-2500XLT can be modified if the manufacturing code on the unit does not end in OBID, other codes ending in D are ok. The BC-700A, BC-700XLTA, BC-760XLT, BC-855XLT, and BC-890XLT are all modifiable if the manufacturing code on the unit does not end in D. No other Bearcat scanners can have their cellular reception unblocked. I do not know how accurate this information is.

I have been unable to obtain information about the modifcations possible for the BC855XLT unit, other than rumors that they exist,

involve jumpers, and could open up the cellular frequencies and double the number of channels.

I purchased a BC855XLT at a Pawn Shop for $40 and successfully modified it by simply experimenting. The date code does NOT end in a D. This document contains the results of my experiments with this scanner.

Keyboard Hacks:

I tried all 385 possible combinations of three keys held down while turning on power. Only three significantly different behaviors were discovered:

MANUAL-0-E Load test frequencies

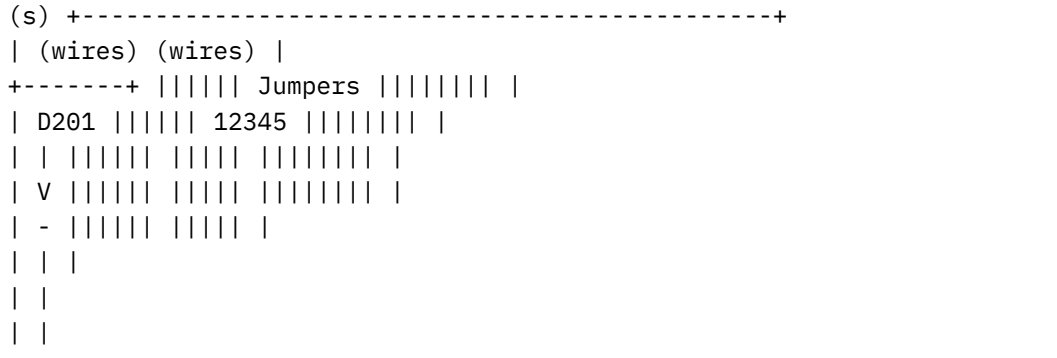
SCAN-0-E Clear all channels to frequency 000.000
Mark all channels as locked out
Clear the search frequency limits

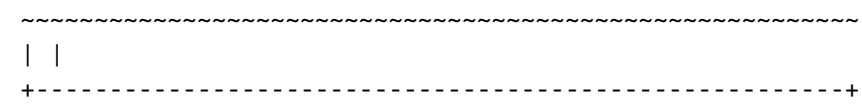
(forget) Clear all channels to frequency 000.000
Mark all channels as NOT locked out
Clear the search frequency limits
(if anyone -really- thinks this is a useful
feature, I have written down somewhere what keys
these were and could look them up)

Hardware Hacks:

First, unplug the power from the back of the case, and remove any antenna connection. Turn the unit over. Carefully remove the five screws holding the case closed. As you open the unit, be careful as there are thin wires connecting circuit boards on the top of the case (the microprocessor/control board) and the bottom of the case (the receiver proper). The wires leading to the speaker should be disconnected (be sure to pull on the connector, not on the wires).

Now lay the botttom of the case on the left, and the top of the case on the right, with the circuit boards uppermost, and the back of the case (with the power and antenna connectors) away from you. Look carefully at the microprocessor board (on the right) and locate the parts and jumpers as shown on the diagram.





In this diagram, (s) represents the speaker, (wires) means several colored wires going to the other board, D201 is a diode marked D201 on the board, and Jumpers 12345 means bare wire jumpers which I (arbitrarily) numbered 1 through 5. The tildes (~) represent a large section of the board which is not depicted.

Each jumper has two ends. The end near where I have Jumpers and 1-5 marked on the diagram I will call the "top". The other end (down toward the rest of the board, or the front of the case) I will call the "bottom". The "bottom" end of each jumper can either be connected across the top of the board (the way it is shipped) or to an alternate pad located on the underside of the board. Look below and determine which of the options you wish to change, and move the corresponding jumper to the alternate connection point.

Carefully remove the (was it 11?) screws holding the processor board to the top of the case. Carefully remove the processor board, and turn it over, from right to left. This leaves the notch for the speaker at the "upper right". You can now locate the pads underneath the jumpers. Each jumper passes through the board, and is soldered to a pad. Just above these pads are other pads, one for each of the jumpers which I numbered 2 through 4. To change the state of any of these four jumpers, cut the jumper on the top side of the board, and jumper the "bottom" end to the corresponding pad on the underneath side of the board, thereby connecting it to its alternate location. Remember that the jumpers are now numbered 54321 from left to right.

Jumper	Connection	Effect
2	Across Top	enables 806-960 MHz frequencies
	Underneath	disables 806-960 MHz frequencies
3	Across Top	enables 29-54 MHz, disables 66-88 MHz
	Underneath	enables 66-88 MHz, disables 29-54 MHz
4	Across Top	enables 50 channels 5 banks of 10 each
	Underneath	enables 100 channels 5 banks of 20 each
5	Across Top	disables cellular frequencies
	Underneath	enables cellular frequencies

The reception on 66-88 MHz was nothing spectacular, but it was ok. Probably changing some coils in the front end would improve reception. One could add a switch to change this at will. But note that I found that modifying any of the jumpers cleared all frequencies when the processor was next powered up.

I don't suppose anyone wants to completely -disable- all 806-960 MHz reception, so I'll assume that you will perform the modifications to

jumpers 4 and 5, possibly 3. This table summarizes the results:

Before Modification After Modification

29 - 54 MHz 29 - 54 MHz (or 66 - 88 MHz)
108 - 174 MHz 108 - 174 MHz
406 - 512 MHz 406 - 512 MHz
806 - 956 MHz (cellular blocked) 806 - 956 (continuous)

50 channels 5 banks of 10 each 100 channels 5 banks of 20 each

Turn the processor board back over, and carefully rethread the screws which hold down the board into the holes, and tighten them. It is best to turn them backwards in the holes until the threads re-engage. If you do not do this carefully, you will soon have holes which take a larger size screw. You have been warned. Also do not overtighten. Tighten only enough so that the board is held snugly.

Now fold the case back together, and re-attach the speaker wire. The connector only goes back one way. Be sure not to pinch any wires between the halves of the case. Also watch for bundles of wires wrapped around or stuck between the volume and squelch controls.

Carefully insert and tighten the five screws holding the case together, following the instructions listed above for the screws holding the processor board. Reattach the antenna and power supply.

Disclaimer:

Intercepting transmissions in the cellular band is illegal.

The reader is responsible for determining the suitability of attempting modifications.

In other words, you are responsible for whatever you do to or with your scanner, and I am not.

Mike

```
char *p="char *p=%c%s%c;main(){printf(p,34,p,34);}";main(){printf(p,34,p,34);}
```

I don't speak for DSC. <- They make me say that.

3481. Needed Mod for PRO 2021

Newsgroup: rec.radio.scanner
Date: 1996-02-12 00:00:00 UTC
From: "Adam L. Caskey" <acc@atlanta.com>
Message-ID: <31200C23.5E0D@atlanta.com>
Source record: 240106

I am hoping someone out there can help me with finding some or any mods I can make to my PRO 2021 to inable it to pick up
800MHz or just additional frequencies. E-mail me directly with any info, and thanks in advance.

Adam L. Caskey

Ho !

: In a previous article, tomuser@aol.com (Tom user) says:
: >No problem with your A8000. Under new law, every scanner which is covering
: >also the regular FM radio frequencies, is legal. It`s just unlegal to hear
: >for example police, fire brigade, phones etc. Have a nice trip
Wrong. You are free to listen to anything you are able to pick up and that
is not protected against listening. So feel free to listen to police and all
the other frequencies. BUT you are not allowed to talk to another person about
what you heard there.

But every device dealing with the airwaves has to be approved by the BZT and
the AR8k is NOT approved. So technically it is not allowed to be used in
germany. But they are sold here anyway (even in shops) so this should not
bother you too much. Just keep it out of sight of any BZT-Inspector. :)

Thilo

The TRS Users page is now on-line at
http://members.aol.com/wwhitby/trs.html

It doesn't have frequencies, but has a listing of users by state and city
and what type of Trunked System they have.

Submissions are still welcome. If you don't see your local TRS there,
send it to me at wwhitby@aol.com (or wwhitby@bdm.com).

BTW, if you have a page, you are welcome to establish a link to the TRS
Users page.

3505. Antenna Suggestions for Military Aircraft Band?

Newsgroup: rec.radio.scanner
Date: 1996-02-12 00:00:00 UTC
From: Bob Cormier <rcormier@mitre.org>
Message-ID: <4fo8l3$369@linus.mitre.org>
Source record: 240130

I want to improve the performance of my Pro-43 Scanner, particularly in the 220-400 MHz military aircraft band. I live in the Washington, DC suburbs and would hope to hear aircraft out of Andrews AFB, Patuxent NAS, etc.

Any suggestions for an antenna that I could mount in the attic of my house? Radio Shack has an inexpensive (< $20.00) 4-element antenna that supposedly covers 100-1300 MHz. Has anyone tried it?

Bob Cormier
rcormier@mitre.org

3506. Re: Why 75 ohm cable? (was: RS discone problems...CELLULAR)

Newsgroup: rec.radio.scanner
Date: 1996-02-12 00:00:00 UTC
From: jparkyn@kilroy.Jpl.Nasa.Gov
Message-ID: <1996Feb12.230722.1327@llyene.jpl.nasa.gov>
Source record: 240131

Picture time!

```
I
___I___ Discone 50 ohms, @2:1 VSWR
/ \
/ \
I 1.5:1 VSWR minimum mismatch HERE
I
I
I
I 75 OHM COAX, RG-6 -7dB/100 feet @400 MHz
I RG-11 -5dB/100 feet @400 MHz
I
I
I
I 1.5:1 VSWR mismatch HERE
[Scanner 50 Ohms]
```

So in VSWR you throw away 8% of your signal and in cable losses you are willing to toss 60 to 80 % of your signal out. Don't forget to throw in losses due to those crummy type F connectors and the adaptors you must use. Is $1.50/foot for Belden 9913 cable what folks are really paying???? My local Ham Radio Outlet charges 69 CENTS per foot and type N connectors are @$6 although you could cut corners and use (ugh) PL-259s.

Belden 9913 is only 2.7dB/100 feet. Why bother with the 75 ohm coax???

Jim

billn@PEAK.ORG (Bill Nelson) wrote:

Gary,

Don't settle for less than the Pro-43 if that's what you really want.
You can *still* get one brand new, in the box, with the cell mod already
done from Durham Radio Sales and Service in Oshawa, Ontario, Canada.

Phone them at (905)436-2100 or point your browser at their home page
at: <http://durhamnet.com/durham> or E-Mail them at:
<durhamradio@osha.igs.net>.

They also still have the Pro-2006's. I got mine from them and I am
very pleased with their service.

>The Ham Station USA

Jeff, the last time I was over there (2 weeks ago) thay were still HEAVYLY using the UHF-public safety frequencies, 460.000 to 461.000 mHz you will be able to find all kinds of traffic relating to law enforcement within the Greater New Orleans Area, Orleans Parish. Uhhh, if thay have gone to a trunked system, I wasn't able to pick it up yet, so far I found a LE net nearby, I am thinking its Slidell PD, or maybe Orleans Parish SO, on a Motorola Type-II trunk, on 855~859.7375mHz... I'm going to be going back on the 18th of the month for a Mardi-Gras festival, and parades for the day, I'll keep a scan all day/night long to find new or changed items and report them back here...

Later, The NeXus! nexus@datasync.com
http://www.datasync.com/~nexus/ My WebPage.

>"base"... just like with cordless phones.

Yes, but thats not called a "repeater" its called "duplexing"
Transmitting on one frequency and receiving on an entirly different
other. Its common for all resturants with a drive-thru and a
communications system to be operating like that, using the intenherint
frequencies with only 1/4watt of power.

My McDonalds uses 154.600mHz with 35.0200mHz But listening to
154.600 you will hear both order box, employee, and all employees with
headsets communicating with one-another... note: this may be
different in other places, my McD's has a strange configuration?

>Better still, ask Mr KFI! - mrkfi@netcom.com

Funny thing is that when Mr.KFI has been asked this question he refuses to even try to answer the question. This has been asked *MANY* times by his minions.

Maybe he really does'nt know the answer...

Maybe he DOES know the answer and thinks it's better to keep it a secret.

Go figure!

As to Percom's web site, I don't know it off-hand, but Chuck or someone here should be able to supply the URL.
Muzak and 3M Sound Products are pushing direct satellite delivery, so it's unlikely that there will be much expansion of existing multi-address systems.

I wanted to thank everyone who gave me tips and suggestions about a new handheld. My parents (with just a little encouragement) gave me a Pro-51 for graduation yesterday, and so far I've been very impressed.

The most impressive thing so far is the speaker: it is equal or better in quality than my desktop. Dad's 200XLT is noticeable "tinny," but mine leans heavily toward the bass side.

The biggest drawback is that it's a bit harder to use than my Bearcat; everything takes a few more keystrokes. But for double the capacity and almost quadruple the speed, I'll learn <G>.

Jim

>scanner is picking up a local AM station, KFI (640 KHz) at
>450.7250 MHz. Given the wide spread between the frequencies,
>I cannot understand what's causing this.

What you are hearing is the "cueing" frequency for news and traffic reporters in the field. 450.725 is in the remote broadcast portion of the uhf band.

You are hearing the "real time"program audio feed *before* it goes thru the delay system that folks hear on 640-AM. It can be pretty funny to listen to as you can hear all the bad words and wild callers before they get "dumped" by the host with the delay system. You will also hear board ops and producers "override" the channel to give time cues to talent in the field. The coverage of 450.725 includes LA/Orange/Riverside/San berdo/Ventura and the coastal portions of San Diego county.

3520. Short Range Radio Freqs

Newsgroup: rec.radio.scanner
Date: 1996-02-12 00:00:00 UTC
From: Jim Whitbeck <whitbje@mail.auburn.edu>
Message-ID: <Pine.SOL.3.91.960211225316.7728E-100000@mallard.duc.auburn.edu>
Source record: 240222
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I just picked up a Pro-51, and I'm ready to take that sucker everywhere and see what's out there.

I was hoping someone would have some idea (general or specific) about what freqs short range radios such as those used at sporting events or by businesses such as contractors for on-site communication. I have a few fast food freqs, but that's about it.

I'm especially interested in the headphone-type radios that have a mouthpiece attached (like telephone operators wear). I saw some in use at a gymnastics meet at Auburn U., and I'd like to know what they're saying.

If anyone can narrow my search down to less than 0.1 - 1300 MHz and/or pass along any general tips, I would really appreciate it. Please e-mail me directly if you can; I'm not sure how often I'll have a chance to read the newsgroups.

Thanks,

Jim

We have just had delivery of our first sample of the new WinRadio unit.
This is a complete scanning receiver covering 500 khz to 1.3 Ghz and is built
on a card that plugs into a PC option slot. All operation is via Windows on the
PC - hence the name!

Full details on our web site at http://www.lowe.co.uk/

>> from the memory.
>> Todd

Todd,
I saw those instructions in the Harruteq scanner book for Ontario. I
tried them on my Pro-51 (date code 5A4) and got exactly the same
result that you did - all channels erased! Now when I want to listen
to cell freqs (not very often actually) I use a limit search on the
image freqs (21.6+).

Yes, saw one last night (2/12/96) Impressive radio. The Retail price of the radio is $ 2199.95 It has some remarkable and numerous features that are not avaiable on any commercial monitor receiver. The technical performance specifications significantly exceed that of the average scanning receiver.

The unit comes with a DTFM decoder, but the CCTSS decoder is an option. There is also an option for a Spectrum display unit.

I don't know when that will be released for sale, but the one I saw was on the way back to the distributor an"Herb A. Zite"

> What makes anyone think that their scanners are made by Uniden?

Of the current RS range (going from the top of my head)..

Manufactured by Uniden....PRO-26
PRO-25
PRO-2036

Manufactured by GRE of Japan....PRO-44
PRO-60
PRO-62
PRO-2035
PRO-2042

GRE now have a manufactuting plant in China. The PRO-62 (or at least the
ones we have) are manufactured there as are the PRO-44's

I know I've missed some off...thats all I could rattle off....

o.k., Drew says they look like Uniden's so Uniden must have made them and Steve says that Uniden makes some and GRE makes some of the others. Again, what proof does anyone have that they are made by Uniden. Just because they look like products of another manufacturer? What is the country of origin? Is it Korea? Tandy's own manufacturing plants are in Korea.

Typically RS has its stuff made by its own plants or companies that only do private label stuff. Very rarely will they go to a quality name brand manufacturer to manufacture something with their name on it because they cannot acheive the same level of profitability. Remember their game is not quality and profit, it is just profit.

Only SOME of the Radio Shack scanners are made by Uniden. Some models are
made by GRE Japan.

>
>Scan Man

Cantel in Ontario has been doing this for some time now. They're simply not re-transmitting the mobile's audio on the cell site transmit frequency. Whether it's an attempt to make monitoring more difficult or only to reduce sidetone and echo in the mobile user's ear I don't know. It's simply annoying.

Regards,

Bob

3547. Looking for interconnection cable for HP8505, 8501 or 8750

From: tpfbear@rain.org
Message-ID: <4fpagi$dsj@news.rain.org>
Source record: 240148

Yes, It is worth it in my opinion. I have had one that I got at a police auction for $100 about 4 years ago, and I got the sales receipt with it when I got it and it originally cost $419.97. This scanner is very versatile and covers many frequencies that my BC200xlt does not cover. It also offers 300 channels and 10 search banks, auto program off of search mode and wide fm, narrow fm and am options and search speed and step options. You can use it in your car or in your home.

Wide frequency coverage:
25-520 MHz
760-824.995
845-869.995
cell freq modifiable
890-1300

Providing that it is in good condition, you should buy it, but ask for a 1 week warranty to make sure it works, and give it a burn in test and run it for 48 hours and try all of the modes and search possibilities. I would pay 100 to 150 for a 2004, just to have a backup. I would rather have one of these that is modifiable than the new garbage that is coming out now days. I would be interested in the name of the person selling the 2004 if you are not interested. Try a compromise offer of $110 and work him down to $125. happy scanning.....

From: w-chase@tamu.edu
Message-ID: <4fqpk5$9dt@news.tamu.edu>
Source record: 240150

Due to the confusion surrounding a holiday visit from my dad and new (step)mom (a great lady!), I lost the original rubber duck antenna that came with my BC-2500XLT. I see a nicely-advertised unit in the Grove catalog. It's their ANT 14, an Austin Condor. Has a had any experience with this antenna? Will it provide any better performance than a cheapy replacement duck?

Thanks!
Bill

3556. Greater Cleveland Monitors...please read

Newsgroup: rec.radio.scanner
Date: 1996-02-13 00:00:00 UTC
From: sdougla@bgsuvax.bgsu.edu
Message-ID: <sdougla.824199775@bgsuvax.bgsu.edu>
Source record: 240151

First off, thanx for taking the time to read this article.

The reason that I posted is that I am trying to compile a book of frequencies and supporting information for monitoring in Cuyahoga County, Ohio.

What I am looking for are kind souls who know more about monitoring in Cuyahoga County that may have archives of frequency info and supporting info including but not limiting to: frequencies, pl tones, dsq codes, channelizations, unit numbers, base locations, type of vehicles/equipment used, signals and codes, roll call times etc.

While I am not limiting what information is provided, I do ask that only information for Cuyahoga County be donated, unless it is impossible to pass such info alone. If the material is published, I do ask that you as well provide full bibliographical reference so that proper permissions may be obtained.

Donaters of material will be recognized in the work, if desired.

Material can be sent via email to: sdougla@bgsuvax.bgsu.edu

Material can be sent via snail mail to: Sean G. Douglas
P. O. Box 29055
Parma, Ohio 44129-0055

For those of you living and/or monitoring in the surrounding counties of Summit, Lake, Lorain, Medina, Geauga and Portage, I will make requests for material in the near future, as I will be compiling books for these counties as well.

Thanx in advance,

Sean G. Douglas

3558. UBC200XLT power problems

Newsgroup: rec.radio.scanner
Date: 1996-02-13 00:00:00 UTC
From: ldp@metropolis.nl
Message-ID: <886.6617T1018T1306@metropolis.nl>
Source record: 240153
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have some problems with my 200XLT. Let me describe the symptoms:

- I can only turn it on if I apply about 10 Volts for a second or so. After this, it operates like normal at the normal 7.2 V battery power. In the beginning, I could get it on by using the AC adaptor, which will increase the battery pack voltage just a bit. Over time, the voltage needed to activate the unit has increased to the 10 Volts it is now.

- Some programmed channels/modes seem to need more power than others, sometimes even so much the unit turns itself off. Extremely annoying if I'm carrying it around and don't have the 10 Volt power supply to 'kickstart' it. I have to lock-out these channels or even the complete bank to prevent the unit from turning itself off.

Can anyone shed a light on this? Can I repair this myself?

> - full numeric keyboard
> - up/down/left/right toggle switch for alpha char entry (again similar to Garmin 45
> - RS232 like interface (no need to be 12 volt swing)
> - Optional SW package to allow full range of data manipulation and up/down load

1. Someone else mentioned CTCSS programming
2. How about at least 1.2AH battery packs. None of these 500mAH stuff.
3. Better audio, better audio amp and larger speakers.
4. Since it is heavily compterized already, how about extensionl speaker
(Speaker Mic style) with alpha-numeric LCD display, like the one ICOM got now.
5. Better case/enclosure like commercial two way radio, none of these
el-cheapo polyethlene bearcat cases.
6. How about better and more flexable rubber duck, perhaps with switchable
pre-amp built inside. BC200XLT's original rubber duck is so stiff, it keeps breaking the
solder
connection inside.
7. How about accessories like, mobile mount plug-in cradle that has antenna connection,
power, and external speaker. I think one of the Maxon CB portable got that. This way you
get in
your car, plug the portable scanner in the cradle, and you got instant mobile scanner.
8. Hey! how about Optoelectronics's Scout reaction tune features built onto the
handheld scanner.

Just a few wishful thinking of mine.

>

Amen! I wouldn't find shopping in Radio Shack nearly as annoying as I do
now, if one, the salespeople would leave me alone for at least a couple of
minutes so I can find what I want (or then decide to ask for help), and
two, if they ask me if I want help that he/she can actually provide it. I
don;t know how many times I've gone into a RS and the salesperson simply
was unable to FIND the product that I'm looking for. I'm not asking for
technical expertise, or to engage the poor slob in some lengthy dialog
about which framastat is better than the other--all I want is to know
where the friggin' product is in the store. Is that too much to ask? The
typical RS droid needs to look up in that damn catalog even basic things
like what a scanner is. Try this: Go in and ask them to explain the
difference between the 2035 and the 2042 and half will try to BS their way
around the question and the other half will say, what's a 2042?

You got questions? Don't ask us because we're clueless, indeed!

I have a Bearcat BC-2 Multi band Scanner (that I have hardly used)
for sale.

It's a pretty neat device in that not only you can just punch in the
state that you are in (and it picks up Police, Highway Patrol, DOT,
weather, etc.) It also alerts you to the presence of radio waves in
the vicinity (has a large red light and beeps). That way it offers
protection from Vascar, airplanes, etc). It retails for $250+ and
mine looks brand new. Includes cigarett lighter plug, mounting
brakets, car radio antenna splitter/and wire antenna (that attaches
to your windshield with small suction cups).

$$ Best Offer.

>Try a pawn shop or used electronics store, as what you want is a used VCR.
>That will give you 6 to 8 hours of audio.

There used to be a casette recorder that was specially
modified to record at a very slow speed, sold by one of the
shortwave radio vendors. Try calling the places that advertise
in the World Radio-Tv Handbook (Whether this is more reliable
than a used VCR is left as an excercise for the reader :-).

From: markmo@kronos.com
Message-ID: <4fqobj$st3@beavis.kronos.com>
Source record: 240171

Hello,

I am looking for advice on an inexpensive (<$50) fullrange (30-900MHz) indoor antenna for my RS 2032. I prefer that it not connect directly to the scanner, so I'll have about 12` of coax.

I've thought of using a mobile antenna indoors, or the Grove Hidden antenna. If the Hidden antenna performs well, it would be an inexpensive choice (only $20).

Thanks for any recommendations.
Please reply to markmo@kronos.com.

-Mark

I disagree with what you say about Radio Shack. I've bought stuff from them for years and haven't had any problems. When I had a problem with something I never had any problem with either getting my money back or a replacement part. I've bought two police scanners - a uniden 16-channel basic scanner and then a about 4 months ago I bought a Radio Shack 100-channel with VHF Air and have never had a problem.

I'm not saying that they're perfect but when I need any electronic parts Radio Shack is the first place I go.

Yes, I saw one last night. Impressive radio. Has remarkable and numerous features not available on most commercial monitor receivers.

The Retail price is $2199.95. and from what I have been able to find out they are not being shipped yet. The one I saw was on the way back to the distributor and not for sale.

There is a two page spec. sheet on the radio, and it comes with a DTMF decoder, but the CCTSS is an option. It also has an option for a spectrum display.

Open some of the scanners up and look at the circuit board, -> UNIDEN
Of course some of their scanners are only licensed from Uniden but
manufactured by Maxon or the like. The Example the 2Meter Amateur HT is
licensed from Icom, but made by Maxon.

Today, when good ol' boy Billy Clinton visited the Portland and
Woodland area, I picked up traffic on the Clark County Sheriff net (the 155mhz
neighborhood) about an altercation involving a needed background check.
Standard stuff so far, but then the sheriff asked for an expedited check
claiming Secret Service involvement. My ears perked up at that.
Then the sheriff advised further contact on LEARN or the LEARN
channel. I kept scanning the 155mhz area and the trunked systems but couldn't
find any other reference to it. Does anyone out there have any ideas or freqs
for this SS activity?

This is not possible. The internal oscillator that the crystal is put into must be tuned to that frequency also. Without changing the capacitors, coils, transistors, and the rest of the following amplifiers, you could never do it. Just get a cell phone and stop trying to do all this illegal crap. B.

There are no hardware mods that I know of, but you can hold down 2, 9 and
Lockout while powering up. It'll wipe out your stored channels and put
some test ones in their place. The last 3 (I think) are in the cell band.
Just search from there.

Happy scans,
Bit

: expect from something so small? (ever try a kenwood TH78a?)
:

I put a little stubby duck antenna on it (one intended for freq. counter) and because the antenna has low gain (Works like crap on any other scanner) it acts as an attenuator, and DRASTICALLY cuts intermod. The R-1 works just as well as any other scanner if you throw a super-low gain antenna on it to compensate for the super-high sensitivity. Plus, the 2" duck makes the whole thing even smaller. I can put it in my jacket with the antenna on it. so there!

>Will it provide any better performance than a cheapy replacement duck?

Yes, it will perform better, but it is SIGNIFICANTLY larger and less
flexible. My favorite right-size duckie is the GRE all-band, availabable
from GRE direct (see their ads). CRB Research (the "Red top" ... it's
orange), or Radio Shack (PRO-34 replacement part).

Excuse the formatting, or lack thereof! But this is from the Grove web page.

~~~~~~

AOR AR 5000 Communications Receiver

Extended Frequency Coverage Receiver!

RCV 12
AOR has scooped the market with their new
AR5000
extended-frequency coverage receiver, tunable
from 10
kHz through 2600 MHz (less cellular) and
offering 650
memory channels in 65 10-channel banks.
Imagine listening
to 60 kHz time signals, VLF naval
communications,
international shortwave broadcasting,
worldwide
single-sideband communications, civilian and
military
aeronautical transmissions, as well as VHF/UHF
public
safety radio, ham repeaters, microwave earth satellites, and much, much more
all on one receiver!

This triple-conversion luxury receiver offers outstanding sensitivity (0.15
microvolt SSB, 0.3
microvolt VHF/UHF, 0.6 microvolt AM), blurring 50-channel-per-second
scan/search speed,
programmable tuning steps from 1 Hz to 1 MHz, all mode reception
(AM/FM/LSB/USB/CW),
selectable IF bandwidths (3/6/15/40/110/220 kHz), superb frequency stability
(+/-1 ppm, 0-50
deg. C.), and mobile or fixed power (12 VDC/120 VAC).

Fully computer-controllable; multiple antenna inputs front-panel or computer-
selectable; compact
(8-1/2"W x 3-1/2"H x 10"D) and lightweight. Options include dual rack mount,
0.5 kHz CW filter,
220 VAC 50/60 Hz AC adaptor.

Limited supplies may delay shipping, so order now!
~~~~~~

3620. CB's(I know) being modified by out-of-range crystals?

Newsgroup: rec.radio.scanner
Date: 1996-02-14 00:00:00 UTC
From: xtrenched@aol.com
Message-ID: <4fs0jc$njd@newsbf02.news.aol.com>
Source record: 240057
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I got really bored one day and began to think. Back when I was playing with CB's, I had to put in crystals for each channel. It finally clicked then that the crystal rating in Mhz was the same frequency the CB broadcast on(I'm almost positive)
Now, obviously, it won't be efficient, but shouldn't you be able to get a say 832.xx crystal and plug it into the tx side to be able to talk on cell phone frequencies?
This is, of course, only a quest for curiousity and I in know way want to do anything illegal...I guess

>on these frequencies and if so where are you located?

Here in Portland, OR, Muzak is licensed to 928.9375. Everytime I checked,
it was muzak. That was a couple of months ago (gee, I wonder why it's been
soooo long since...)

>Also, in general, how do you look up who frequencies are allocated to in
>the 900 Mhz band? Is there anything online where you can look up someone
>by name and find what frequency they are allocated to? Or books? I
>looked in the Radio Shack guide and they have very little listed in the
>900Mhz band.

The Radio Shack guides tend to be restricted to public service agencies. Generic
FCC databases from folks like Grove and Percon have *all* service classes,
including Muzak. Most databases allow you to enter low and high frequency
limits for the databases to search between.

Anyone remember the Amtrak train wreck in New York state in the late
80's.

The Engineer was convicted of smoking pot and man slaughter....killed a
few people!

Head on wreck in 1992 on Highway 152 in Watsonville,California...two
dead...driver convicted of operating a car under the influence of pot.

August of 1995...highway 101 in Gilroy,Ca...truck driver with suspended
licenese...3 dead(entire family)driver of truck tested positive for meth
use.Driver being tried for murder.

Shall I continue....

Jr college football players on the way home from a game in April of
1995...driving on highway 1 south of Santa Cruz,Ca...driver smoking a
joint...slamms into the center divider...kills his buddy.

Before you post statements like this I would suggest you talk to your
local State Trooper/Highway Patrol Officer/E.M.S. professional or an
Emergency Room Doctor...If they can't cite many cases of "drugged
drivers" then ask a local TV or Newspaper Photographer.

If you have www access go to http://www.interlog.com/~jmckay and follow
the scanner links to RON KATZ page. He has freq listings for toronto
fire and lots more. I think ch 6 may be the repeater that links to
the Ontario fire marshal common channel 154.07. They use this repeater
when they want to talk to adjacent fire departments.

Hi to all Radio Scanner listeners.

I assume there must be quite a few of you reading this who live in the Perth, West.Aust. Metro area.

It would be great if you could make yourself known and leave an E-Mail,also as time goes by maybe we could all share some interesting frequencies. Unfortunately at this time i am not upto date with a frequency list and are still looking for frequencies.

MAYBE you can help ???

Westrail Security Gaurds - Locum Medical (after hours Doctors Service)
Metro Bus - TV NEWS Helicopter.
or any others you may think are interesting & upto date.
Most people seem to have the Police, Fire, Ambulance & Aircraft
but surley ther is more. Lets share the common interest.

Send an E-Mail now and have a local Perth group of contacts.

Thanks Guys

Tom (tomm@vianet.net.au)

>do anything illegal...I guess

Well no... 99.9% probability that it won't work at all. The crystal(s)
are just there to create the signals you need. After that they are of
course modulated, perhaps multiplied, and amplified in your transmitter.
Just about all other RF circuitry in the rig is "tuned" for the
frequencies you are using. Everything in a CB is set up for 27 MHz. You
probabaly wouldn't 800 MHz to go anywhere inside the radio, let alone to
the antenna.

I am in need of the schematics of the Radio Shack Pro-2021. I just inherited the scanner from a relative who said it was in perfect working condition. But when I plugged it in, the display did not light up and it then emitted some smoke.

I did do some checking into it last night and did find that there is a resistor that connects from the Neutral side of the power cord to the case is dead (no resistance). And further probing shows that the voltage regulator is dead.

Any help is greatly appreciated. Also if someone has a list of Rochester, NY frequencies, I would be interested in them.

Thank you.

3640. Computer Scanning FAQ

Newsgroup: rec.radio.scanner
Date: 1996-02-14 00:00:00 UTC
From: michael@alexander.terranet.com
Message-ID: <michael-1402961811070001@alexander.terranet.com>
Source record: 240077

Rob Bellville has been kind enough to post the beta version of my computer-aided scanning FAQ on his web site, www.ultranet.com/~bellvill. I've put a lot of work into the FAQ, trying to anticipate the sort of questions people who want to hook up their scanners to their desktop computers might have. Unfortunately, there is still work to be done, but I just don't have the time right now, so I figured that if I posted the FAQ, some other kind souls would be impelled to leap in with a hand.

Anyway, take a look at it, give me your suggestions and comments on what you think needs fixing, what think ought to be there that isn't and so on. Note that I've basically taken marketing hype from the scanner software vendors, cleaned it up and then listed the salient features. At this minute, I'm running through the demo and live versions of software and when I can get to it, I'll flesh out the software with some personal observations (better yet, with some of your personal observations) that get around the hyped up claims.

Notice I said, "give me your suggestions and comments." You got complaints, stick 'em in your ear (said only in partial jest). My earlier call for assistance triggered an avalanche of responses--from 1-2 people!

Message-ID: <NEWTNews.824311691.17061.mikec@u>
Source record: 240078

Anyone in the western suburbs of Chicago caught the interference in and around Naperville? I find it generally in the 860mhz range (Naperville PD) and only between Naper Blvd and Washington, Ogden and Warrenville Road. It sounds almost like a trunked system's guard channel, but isn't. It has very regular pulses at about 1.5 seconds.

AT&T, Amoco Research, Bectel, and Hewlett Packard all have facilities within this area. If you get outside the boundaries mentioned above, it pretty much goes away. Within the area you can pick it up on any of the Naperville trunked freqs.

Any help would be appreciated. I know this is a local question (I am hoping Bill Parnass sees this :)).

Thanks in advance
Mike

From: howard_jim@isa.com
Message-ID: <4frn8h$ktp@tin.monsanto.com>
Source record: 240085

Does anyone know how to do this? Now, before you all jump down my throat for asking a dumb question, let me make my self clear. I have seen ads all over town for places that will program 2 phones on one cellular number. Why can't I do that myself? I have service with a company, and have a handheld cell phone that works. I also have a mountable car phone that isn't active. Why can't I program the car phone to work on the same service I already pay for? The cell company will do it, but they want to charge me double every month for doing so... Sounds like the old battle I used to have with the TV cable company...

Anyway, I'd just like to know if this can be done, and how?

Any comments?
Jim Howard

3649. Uniden 800 numbers changed

Marti is a brand name of a remote broadcast system usually used to
send radio broadcasts from the ball game, mall or car lot grand
opening etc back to the studio for broadcast. There are several
other brands but most people call them Marti since they are the
popular brand. Usually vhf or uhf but some 900 Mhz types have been
used.

I think Marti also made a STL system.. (studio to Transmitter)

3653. AR3000 mods

Newsgroup: rec.radio.scanner
Date: 1996-02-15 00:00:00 UTC
From: Enrico Segre <segre@polito.it>
Message-ID: <312375CB.17B8@polito.it>
Source record: 239941

Hi net,
I have recently resolved to start tampering with my first series
AOR3000. To begin with, I chopped off the high pass filter on
AM/NFM/SSB audio freq. The mod is quite easy, though delicate, it
involves unsoldering a SMD R and a C and soldering an extra C and
a shunt (other variants may be devised). The low freq limit appears
to be now ~60Hz rather than the original 3OOHz, and I've found
the readability of broadcast transmission and of speech to be largely
improved. If interested I may email details. Rather, however, I
would like to exchange comments with anybody who has tried anyting
else in that box. My next to do mod would be to add a switchable
narrower 455kHz filter to improve AM selectivity. I'd expect
it to improve slightly the shortwave reception, but I wonder
to which extent it will help. The 3k notoriously suffers hopelessly
from front end intermodulation and wide IF (which in turn is a design
choice, due to WFM requirements and tunable 2nd local osc).
Looking forward to read,

e.s.

Hi John,

-> fire and lots more. I think ch 6 may be the repeater that links to
-> the Ontario fire marshal common channel 154.07. They use this
-> repeater when they want to talk to adjacent fire departments.

Yep, Channel 6 is repeated onto the OFM channel, but it is also
TFD's simplex operational channel. TFD uses it for situations
like subway rescue calls where the normal repeater operation
won't work.

Regards
Paul

Well, actually, the price is just about right on for a mint condition
PRO2006, based on the data that I have been collecting over the past year
(price guide is posted to www.ultranet.com/~bellvill/scanner.html).
Although it's true that Durham sells them for $379, I'll bet you get
slapped with customs fees of $15-$20 as well as shipping charges of
$15-$20, putting you over the $400 mark without any trouble.

Marshall:

What kind of battery life are you getting with the 3000XLT. I'm thinking of buying one, but am somewhat put off by having to use a special battery pack. I have an AOR 1000 that takes AA batteries, which can be found everywhere.

Cheers,

PJ

With this hobby under attack from the federal government and certain radio systems manufacturers, I think sniping at each other is counterproductive. Should you not like Mr. Cheek's products, don't buy them or write a review for one of the many scanning publications out there (National Scanning, RCMA, etc.). I personally have found Mr Cheek to be a relatively nice person and his books informative and helpful. Constructive criticism is always helpful. Personal attacks help no one.

Some readers have been telling me they have had problems accessing my pages.

http://www.innotts.co.uk/~asperges/

The local server has been having problems, so do please keep trying.

* The pages have an extensive list of links,
* an explanation of aspects of amateur radio,
* new special pages for SWLs (listeners) with broadcast web page access,*
* an IRC link,
* a tour of local historical site near the QTH,
* a mock exam,
* and even a history of Robert Burns, the Scots poet.

So it's worth the wait!

All welcome and I will reply to all e-mails sent through the pages.
2100 visitors to date (despite the recent server problems) since January.

Cross-posted to: alt.radio.scanner,rec.radio.scanner

I was just searching through the Oak.Oakland.edu mod site, an
noticed a NEW pro-43 mod that supposedly restores 6Mhz-1000Mhz reception,
has anyone tried this modification out??? I realize that the performance
is obviously not going to be awesome, but the price is right. Time only. I
am planning on getting my roommate (Electrical Engineering Graduate
Student) to look it over before performing it, but it looks possible, or
at least like it won't fry my scanner.
Any Thoughts or Ideas
Thank you
dbowlby@chat.carleton.ca

Wow it's just amazing how much flaming gets going when a simple
question gets asked. I think it's just the inaccuracys of a non
face-to-face english language conversation,, you dudes probably
violently agree on tv antenna costs, quality, and the original poster,
now forgotten im sure is quite amazed by the short flame war.

All that aside i think i have a more technical yes or no
question (well maybee not. One assumed need for this hi-gain scanner
antenna is surfing cellular radio. Is a beam/unidirectional technology
really a good match. How could you use it effectively since the mobile
targets are moving, and you really would want to hear as many fixed
cell-sites as possible, and omidirectional antennas would seem to be the
best fit. If "cheep discones" provide limited improvement, what is the
best option for this portion of the spectrum?

I've had success in decoding Frequency Inversion Scrambled cordless phones with my ICOM R7000 by going to the USB of the frequency and offsetting it by 1.5 to 2.2 khz. This trick also works with my AOR1500, but using the BFO.

I also have a decoder that I purchased in 1982 (which was legal back them) and it
really didn't perform any better than my trick of using USB on my ICOM

I was just wondering if there are
>_any_ mods for cell/speed/memories... etc. Also, I was just wondering
>what the Bearcat equivalent to this model is...
>
I do not believe that you can modify the newer 'B' units. And the 2026
is ALMOST a twin of the Uniden BC-760XLT, but there are some differences
and they are not 100% compatable.

3665. Virtual downconverter, PRO2035/PRO2042, what is it?

Newsgroup: rec.radio.scanner
Date: 1996-02-15 00:00:00 UTC
From: anon1723@nyx10.cs.du.edu
Message-ID: <4g0ot5$8jl@nyx10.cs.du.edu>
Source record: 239953

I was reading an article in a scanner magazine and there was an ad offering a "virtual downconverter" for the PRO-2035 for $99. This is something to presumably allow less restrictions on access to the 800-900Mhz frequencies.

What do they give you for the $99? Instructions on how to do it? Do you send your radio in and they fix it for you?

What about the PRO-2042, can the same virtual downconverter work with it?

>name brand manufacturer to manufacture something with their name on
>it because they cannot acheive the same level of profitability.
>Remember their game is not quality and profit, it is just profit.

Not completely true. Tandy has some plants that make their own stuff.
But not usually from "raw material".

They often build "knock off" type equipment under license. For example,
a few years ago they were selling a transportable cell phone very similar
to the Nokia/Mobira. In fact it was the Nokia design. Tandy was
assembiling their own private lable version in Asia while the real Nokia
was made in Europe. All done under a license from Nokia.

Same goes for other radios. Many of their CBs, scanners, etc are made
with internal parts (assembled boards) manufactured by Uniden and others.
Tandy puts the Uniden "guts" into a slightly different package in thier
own, or third party facilities (usually in Asia).

Another product line that I used to be familair with was thier home
security products. Alarm door/window contacts, "window bugs" etc. That
were made by United Security Products in Livermore, CA.

I did some business with Memorex several years ago and was surprised to
hear that Tandy Magnetics made Memorex audio tapes (cassettes, etc.).
That's right Tandy made the stuff for, and owned an interest in Memorex.
This was several years ago and I don't know what the arrangemnets are
currently.

This is just to point out that you might be surprised at what is actually
in the box when you purchase something from RS. The big way they cut
cost over the "name brands" they use is the way they package it.

>I only have 29" to work with. Any help would be appreciated.

Looks like you're calculating for the wavelength in freespace.
The length of the antenna will be effcted by things such as the
material used and it's diameter (the diameter will have more effect
on the bandwidth of the antenna).

16" is probably close enough for a single band antenna. The
inductance along the length of the conductor used for the whip will
probably require it to be a little bit shorter.

3669. missing location for Radio MODS? (Pro-51)

> And Sears, JC Pennys, etc.
>

The reason everybody is bitching is because we always see clueless people
getting sold the wrong thing at Radio Shack. These "clueless" people
expect to get good service when they go. Why do they expect good service?
Because they see things such as:

"You've got questions, we've got answers" and

"...our electronics experts who provide outstanding product knowledge and
customer care in our stores."

When you see something like this you EXPECT to get (right) answers when you
have questions. I know enough about the products that I don't get stuck
with the wrong crap. What I do have a problem with is when I take a
defective product back and it takes them 45 minutes to figure out how it
works before exchanging it. When I go to Sears, I know the emphasis is on
Quality and low price, they don't have the big "experts" slogan, and even
then I find them more knowledgeable in their electronics department than
Radio Shack. At Radio Shack you have a reasonable expectation of good
service. Most of the time you get none

--

I have a similar problem...where one of my battery packs works fine (since
I put new nicad solder packs into it) but the other pack that I replaced
the nicads with does not work on its own...The first one works whether the
transformer is plugged into it or not..
The second on only works when the 12v transformer is plugged into the back
and is supposedly charging. When I unplug the transformer from the pack,
It turns off as if the batteries are dead(when I know the batteries are
good, or even overcharged slightly)

Does anyone know what components in the charging system of the battery
pack I might be able to replace or how to check them?
I have tried using two different transformers :
1. a 12v dc 500mA transformer and
2. a 12v dc 800mA transformer.............with the same
results.................................I disabled the low battery signal on the radio
to see
if it would make things better, but no change.

Any suggestions appreciated............perhaps running the battery down with
a light bulb and then trying charging again?

The mod is easy. This will give you 137-174mhz and 410-470mhz Tx/Rx.

1. disconnect power and antenna (like, you would'nt of done it already.)
2. open up the case by removing the screws and gently removing the cover and unpluging the speaker.
3. locate and CUT the GREEN WIRE on the CONTROL BOARD (the vertical board behind the control panel.
4. reassemble the radio.
5. RESET THE MICROPROCESSOR (so much for the memory!)

(press and hold [D/M] & [REV] & [ENT] & turn the power on (got enough fingers?).

(turn off the radio).

(press and hold [SCAN] & [HOME] & turn on the radio (extended RX mod).

Tha, Tha, Tha, That's All Folks!

3682. NZ police freqs?

3688. Free Powerful Utility Program for CE-232 Scanner/Computer Interface

Newsgroup: rec.radio.scanner
Date: 1996-02-15 00:00:00 UTC
From: bcheek@cts.com
Message-ID: <4funh3$ckm@news2.cts.com>
Source record: 240019
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Available for download from the free file area on the
Hertzian Intercept BBS (619) 578-9247 (5:30pm-1:30pm),
a powerful AutoProgrammer file extraction utility for
the CE-232 Scanner/Computer Interface, described as follows:

APF117.EXE 80166 09/16/1995 01:17 (a self extracting archive)

APFTools ver. 1.17 9/16/95
by Reid Drummond, Barstow, CA

A Scanner Hacker's Utility
For IBM compatible computers

APFTools is free and released to public domain.

APFTools was developed primarily to create APF files for use
with PRO-2004/5/6 scanners and others that use the CE-232 scanner
interface. APFTools creates APFs and frequency lists by reading
frequencies from any ASCII file or APF regardless of the format.
It can process large files and create APFs of the proper length
for the particular scanner. It also has features to put a trigger
frequency for LINKALL in the last channel.

APFTools does not require any complicated commands. Just enter
the file names and respond to the single key prompts. APFTools is
not sensitive to the data field length or position in the file. It
will even extract frequencies from a mix of APFs and frequency
listings in the same file. It can read more than one frequency per
line, so listings in tabular format are no problem. All text and
miscellaneous characters are removed. Frequencies do not require
spaces or commas adjacent to them to be readable and input files do
not require editing prior to being processed. Files can be merged
with an existing file and any output file can be run through the
program again to change the format or numbering sequence. The
program searches for frequencies from 1 MHz to 2.3 Ghz (adjustable
by the user).

Minimum system requirements: 8088 processor, DOS 2.11, floppy drive.
(Hard drive and faster processor recommended.)

APFTools will extract a valid AutoProgrammer file for the CE-232
Interface from the following haphazard, chaotic file!

Don't be misled: you are not qualified or capable of making any
legitimate assertions about anyone or anything aside from your fat
duff, and even then, there is *ample* room for doubt since you sit on
it so much.

You might consider spraying some Windex on that little window in your
lower belly......the one you look out of a lot. And get off your
duff, Duff, and post something worthwhile.

Or pack sand.........

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Abstract

This article contains product review summaries for more |
than 60 old and new scanner radios and monitor receivers.
Other topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 110 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be
complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had
sellers look me square in the eye and tell me their radio

worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making

scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews of these recent scanner models in Monitoring Times magazine:

Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042

Note: Reprints of Monitoring Times articles are available for $2.00 each from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are | 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 | Portable Scanner," by Bob Parnass, AJ9S, in Monitoring | Times, October and November 1995.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's

a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in

binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light

panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner

unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF | -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable

portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-

2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - | 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast.

Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs | -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful

speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning.

PRO-26: 1985 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, | 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker.

PRO-62: 1984 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than

Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split"

models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Cystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Find and identify transmitter sites with RadioMap(tm)

3695. 3000xlt - did I get a lemon?

Newsgroup: rec.radio.scanner
Date: 1996-02-15 00:00:00 UTC
From: bnr@universe.digex.net
Message-ID: <4fva1v$s7a@news4.digex.net>
Source record: 240026

I just rec'd my bc3000xlt mail order. After programming some local freq's (fire and police - 494 and 495 range), I noticed traffic seemed slow. I turned on my old Pro-2023 and compared reception. The 2023 picked up twice the traffic the new 3000 did. When I played with the squelch control I found if I opened the squelch up to where it would receive the signals - it would not release the channel back to scan. Also on several occasions it will keep all the channels open with static noise even with the squelch cut all the way back. I have adjusted the squelch, the attenuator, even changed the mode from NFM to WFM - all to no avail.

This is my first high end scanner and if and old $80 RS PRO 2023 can out perform a $400 one - why spend the money? Should I attempt to return this one for another (I like the features) or should I step down to the 220xlt? I had an SC-150 before this 3000xlt (I returned the 150 to upgrade to the 3000) and I had no trouble with reception on the 150. Tonight I plan to compare reception with a 220xlt a neighbor has.

All suggestions, comments, and/or advice -- Gladly accepted!!!

I know it is generally illegal in Michigan. However, if you are a licensed technician-class or higher ham radio operator, you are permitted under Federal law to carry scanners (and any other legal radio equipment) in your vehicle. I do not recall the exact reference for this, but it is in the amateur radio regulations, which I believe are 18 CFR part 97. (CFR = Code of Federal Regulations).

As an aside, in Michigan, non-hams can carry scanners if they have a permit. And, if you go to the IL state police, and present them with copies of a photo ID and your ham license, they will issue you one of those permits. When I was in Michigan, I did that, so that if I ever had a problem, I could show the cops the MI permit, rather than having to debate the law with them.

/MC

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend

reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two

companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees,

listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about

$100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, | companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall

security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an

outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $27.00 per year, which includes the monthly Scanner Journal, approximately 50 pages in 8-1/2" x 11" format. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. The RCMA web page is at http://comp.uark.edu/~plaws/rcma/. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

All meetings are held on Saturdays at locations announced in advance. The next few meetings may be held at the |
Destiny Restaurant, on Rand Road, in Des Plaines, IL.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and
larger book stores for under $13. Police Call is basically
a computer printout of FCC license information in the fire,
police, local government, and conservation services in two
lists: by licensee name within state, and by frequency.
Later editions have included a few pages of local airport
and nonsensitive federal government frequencies. The 1996
edition contains selected business frequencies, too, but
callsigns are listed only for local government and public
safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local

agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, | companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information

fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 50 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s]

missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Will Flor (willf@rrgroup.com) wrote:

: The 956 MHz frequency you mention is carrying a STL (studio-transmitter
: link) for a station's : SCA channel, which is how "Muzak" and other
: similar services are broadcast. This is commonly : found in the 944-960
: MHz band in any major city. These are usually found in a different :
: portion of this band (usually more like 944-952) so the poster may have
: been hearing an image : 10MHz or so above the actual frequency, or it may
: simply have been a station with its STLs in : an unusual portion of the
: band; I know some stations are "grandfathered" this way. The 928 MHz :
: frequency you mention is not in a band used for STLs AFAIK; that band is
: usually used for : one-way or two-way telemetry of things like power
: distribution systems, burglar alarm : monitoring, etc. These are probably
: the data transmissions you found on these frequencies. : Again, the
: original poster may have been receiving an image, or it may have been a
: station with an unusual frequency allocation.

I'm not sure I agree. I'm almost certain that the radio station would do the SCA (as well as FM stereo) encoding at their studio location, then beam the entire composite FM signal to the transmitter via the STL. Otherwise, they would need, perhaps, 3 separate STL frequencies, one for the main channel and one for each of the two Muzak programs. And having the SCA encoder at the transmitter site would just make it harder to maintain.

The scanner listener could pick the Muzak broadcast by tuning to the STL, but he would need an SCA decoder in the scanner. Scanners do not typically have these unless you cut them open and add them in yourself.

I know of 3 sources for audio scrambler/descramblers.
1. The Fall 1994 issue of Electronics Hobbyists handbook (put out by Popular Electronics)has a construction article on building an analog version using op-amps and National Semiconductors balanced mod.demod. ICs. A kit of parts is available from Weeder Technologies, P.O.Box 421, Batavia, OH 45103 for $29.00 and the pcb for an additional $14.00. Or get it fully assembled for $69.00 plus $3.50 S&H.

2. The December 1993 issue of Electronics NOW has a construction article on building a digital version. A kit of parts is available from North Country Radio, P.O.Box 53, Wykagyl Station, New Rochelle, NY 10804 for $59.00 plus $3.50 S&H.

3. Ramsey Electronics (1-800-446-2295) has model SS-70A Speech Descrambler/Scrambler as a kit for $39.95 plus $14.95 for a case. Or fully assembled for $79.95 plus $4.50 S&H.

Bob.....

Batt pack problems
>snip<##################################
I've had repeated problems with two 200xlt batt. packs.
Found the 12vdc male board mounted connector was the problem. It was
coming loose and breaking the circuit board copper trace.
After much trouble I was able to fix both by disassembling and
slobbering the hell out of the broken area.
Batt. pak #1 a-ok after 1 year. Battery pak #2's connector came loose
again after one weeks use! Haven't gone back in for rerepair yet.
I would have been better off if I had epoxied the connectors back on the
board as well.
I also have had both male connectors casings break apart.
Has anyone gotten any satisfaction from Uniden on this obvious poor
design problem?
TIA,
Temp

I have a PRO-43 manufactured prior to the cell-ban. I do have 1 year left on the R.S. Extended Warranty. I have heard that if I send it in for repair (it receives poorly now) I may not receive back a unit with the same cellular capability, as someone my swap my main board with a post 4/94 unit. Has anyone had a similar experience?? Should I just take it into a respectable radio shop?? I do not have the tech manual nor do I wish to tune it up myself.

I have the DTMF demo somewhere on my HD'(s)- just gotta dig it out! I think it is one of Mr. Chris Smolinskli's creations.

I have an R7000 (and an AR2800) and, not being a ham, love to eavesdrop on their packet stuff- "wanna be ham, maybe?" I figure the airwaves are polluted enough without me though!

Anyhow, I just got done with disaster recovery, motherboard replacement & system upgrades (not necessarily in that order-) on my IIfx and then ordered a "Port Juggler" to run the R-7000 & MFJ-1278 over one of the serial ports.

I havge been putting this off over 5 years due to hardware & software limitations, but I come closer each year! ;-)

"just one more bug in the R-7000 code! Hear that, Chris ;-)?"

Hello bnr, I have a BC220XLT and really like it... It's sentive and tough to boot.... I would advise if you return your 3000XLT for a new one, or get a 220XLT, that you also puchase a leather case for it... It will protect your scanner quite a bit...And you will still have access to the functions...It also helps keeps your fingers off the scanner so as to keep the bank numbers on the unit from wiping off..... The oil on your hand really raises havoc with these... I've owed mine since last August, and never regretted it.... Though I wish I had the money at the time to buy the most expensive one...
Good luck, and let me know how do.....Later, Norman

Message-ID: <4g3dab$nc8@nyx10.cs.du.edu>
Source record: 239794

Can anyone explain how SCA signals from television stations work? Does anyone have experience with picking them up on a scanner?

How do TV SCA's differ from (or are they the same thing as) the "SAP", or "Second Audio Program". Are there SCA signals which cannot be heard by by a television set's SAP capability?

Are SCA or SAP signals done by having an addional FM carrier near the "normal" sound carrier of the TV signal. Or are they done by FM-on-FM modulation on the original sound carrier, which would require some type of modification to the scanner to receive?

And what types of things might be found on television station SCA's? Are the stations restricted to using their SCA for their own operation (i.e. cueing remote broadcasts), or can they lease the subcarrier to anyone for purposes similar to the SCA's of broadcast FM stations?

I believe he was talking about LERN--the Law Enforcement Radio Net, on 155.37.
Oregon State Police et al around here tend to use the Oregon Police Emergency
net (OPEN). I have LERN filed under my Washington State Patrol frequencies.
This would make sense since he first flew into Washington state, then back
down to Oregon.

I had similar problems with my BC200XLT some years ago. The low
battery situation was quickly fixed after removing R208 and D203
from the lowest board (the one with the display and CPU).
However a second intermittent power problem remained, and I
eventually traced it down to the power pack, where I found a couple
of "cold" soldering connections at the power plug, which, after
resoldered, solved those problems permanently.

G > Yeah...I know you can't get cellular reception on these models.

I've come up with a mod that allows the Pro-26 to receive or search ALL locked-out frequencies with full sensitivity! It only requires one jumper across an IC chip - no other parts - so just about anyone with "soldering iron skills" should be able to do it. (the usual warranty/disclaimers apply).
I've got detailed instructions with diagrams on how to do the above, including a mod for the backlight to stay on and not go off after 15 seconds. The backlight mod requires a couple of parts though, and is a bit more involved (one has to solder to tiny surface mount parts).

Anyone interested can send me their (printed!) address, $4.00 US or Can, and a first class stamp to:

I don't know about "virtual converters" but the GRE Super Converter II is about the size of 2 and 1/2 9 Volt transistor batteries and fits between your scanners BNC ant connector and the rubber ducky. A switch on it allows using the downconverter or bypassing it. It converts 800 thru 912 Mhz to 400 thru 510 Mhz. Works like a champ!

3731. Re: AM on UHF???(KFI L.A.)

Newsgroup: rec.radio.scanner
Date: 1996-02-16 00:00:00 UTC
From: corbin@physics.ucla.edu
Message-ID: <4g2mkt$1f3o@saba.info.ucla.edu>
Source record: 239812

At the risk of being the N'th person to provide a limited answer to what's going on vis-a-vis KFI on 450.xxx ...

The 450.000-451.000 MHz range is allocated to broadcasters for Remote Broadcast Pickup - typically, these frequencies are used to coordinate live remote broadcasting (usually newsgathering, sometimes special events, sports,...)

It's not all that uncommon to hear the broadcast audio retransmitted on one of these frequencies - particularly around 5pm or 6pm 8*) Typically this retransmission ultimately winds up in the earphone of the person actually doing the remote, multiplexed with cues from the studio like 'you're almost up' and 'ok, wrap it up...' (or my favorite - 'we're cutting you off in 5... 4... 3... 2...')

It's been a few years since I last paid much attention to 450, but back then it seemed like about half the TV stations simulcast for the full duration of their newscasts, and the the others for the live-news segment +- 15 minutes (One station simulcast for the full newscast +- 1.5 hrs)...

KFI is doing something wierd. They're not simulcasting on a sporadic basis, but rather full time. At first glance, I'm tempted to suspect they're using a 450 transmitter like a Studio-Transmitter-Link (STL), but STL's are supposed to live up around 950MHz (I'm not sure that 'permanent' STL's are allowed in 450MHz). I don't listen to KFI, but they don't strike me as a station that does a lot of live-remotes (at least not in the sense of requiring a permanent bc simulcast). Maybe some of their segments are coming from remote studios, and this provides a feedback loop for those sites? Or perhaps they're just taking advantage of their 450 allocation to appeal to the techy types 8*(There was a station on the east coast that got popped years ago for doing essentially just that...

At any rate - I hope this helps... //Brent

>>chop chop<<
I was not, nor am I attacking anyone. I just wanted folks to be aware
that the large value backup capacitors exist are are very usefull in the
right place. I do not wish to participate in anyones fight. Please
reread my original response, I mad a point not to take sides. Besides,I
suspect that most people would find all of us a little strange. After
all, haven;t you got some pretty wierd looks when you try to explain
why you listen to your scanner?
Lets all get on with our lifes. I don't care if Andy and/or Bill are both
sane, crazy or whatever. This is supposed to be a group for the support
of scanning operations. In that vein, I tried to put some light on a
rather confussing area of our hobby. After all, it is hard to believe
that a "little" capacitor could realy keep your Cmos memory alive for
at least several months. I suspect that for most people the best backup
is the little lithium cell. For us real tightwads, the back up caps are
a good solution to some problems. They are most usefull for radio(or
whatevers) that are on most of the time, and only need to "coast" thru
short power outages.
I hope that thi information was usefull, but lets stop throwing stones
at each other. Hell, if I want to fight I can always go to a family
reunion or local ham club meeting. This is supposed to be fun.
Isn't it?

Washington State has LERN-Law Enforcement Radio Network, I think. 155.37. SS
often uses mutual aid channels to coordinate with locals/county/state.

Don

>getting shouldrecieve the cellular band?

>fresco@j51.com

As of Jan-1995 the FCC ordered all manufactures of scanners to
completely block out the portion of the 800mHz band that is used by
cellular companies. If your radio was manufactured before Jan-1995,
and if it has 800mHz in it, then there is a good possiblity that you
can have this scanner modified to widen the frequency range, if
manufactured AFTER Jan-1995, then no, there is no modification for
scanners. I find it hard to beleive how some people will tell you and
I that they have a MOD for post-mod-ban scanners.... I just do. But
don't sweat it, just buy your scanner, set it up to do a band search
between 896.000mHz to 915.000mHz, you'll find TONS of cell actvity
there, I've never modified any of my scanners (I don't have too)! :)

Later.

errr ... Title 18 is "Conservation of Power and Water Resources". I kinda
doubt that the TVA is too concerned with ham radio (Telecommunications is in
Title 47).

The federal preemption was an FCC declaratory ruling, PR Docket No. 91-36;
FCC 93-410, effective 18 Oct 93. It makes no distiction as to license class
and only applies to ham transceivers that incidently receive out-of-band. It
does not apply to scanners.

I had this problem too. I replaced the connector, and it's allright now.

My batterypack is not the problem. Even if I power my scanner straight from a regulated power supply it won't switch on until I put about 9 or 10 Volts on it. After this the batterypack will gladly power my scanner. That is, until I scan past a channel in the 470 MHz range... bzzzt, my scanner powered off all by itself.

There is a good article on this subject in the February, 1996 Nuts& Volts magazine. The article is titled "Cellular Extensions on Trial".

I called them for a trial copy, and they actually sent me three months worth. It seems to be a useful "trader-type" magazine, with a mixture of articles. Nuts & Volts can be reached at 1-800-783-4624. I'll probably subscribe.

Bottom Line - Revenue for additional lines is important to the cellular companies. I did not read of any technical reasons against it if only one set is operational at a time. A friend of mine in the cellular industry said that it would drive the system nuts if two like sets were on the system at the same time.

Morriseau's price "advice" is pure opinion and has no basis in reality. I have collected data on the used selling prices of scanners for about a year now, including the ICOM7000 (the blocked model is usually designated ICOM 7000-2). The data is based not on the asking price, but the actual selling price. Of the three mint condition ICOM 7000s that I have tracked, one sold for $800 and two sold for $900. The $800 unit included the computer interface. Answer to your question is, your unit is worth $800 to $900, probably closer to $800 because the low end selling price of the more capable ICOM 7100 is $1000.

From: "Jeff Fischer"@thefishnet.com
Message-ID: <8BAE247.007E0027EC.uuout@thefishnet.com>
Source record: 239977

I have a Pro 2006 Scanner that I would like to sell.
Is in excellent condition. Reason for selling is it just doesn't
get any use anymore and know someone could use it more then me.
The cellular and speed scan mod has been done.
I would like $300 for it plus shipping if required.
I have a source to use credit cards, but there is 5% added on top
Leave a note to jeff.fischer@thefishnet.com if interested

>airport in the area. So if anyone has air frequencies for either
>Portland or frequecies that are used nationwide I would very much
>appreciate it if someone could send them to me. THANKS!!!

Sean,

Here is a list captured while searching the aircraft range the day
before the Pres. arrived:

(not in order)
118.85
128.35
127.475
127.975
122.3
124.2
119.5
118.1
119.65
118.825
133.275
126.0
126.6
133.9
133.7
133.675
128.75
128.725
123.775
122.75
122.7
121.575
120.475
121.625
123.825
127.525
128.025
128.775
133.725
128.3
129.425

125.8
129.725
132.0
135.35
118.7
120.3
126.9 Real Active
129.7
133.0
120.5
135.45

Try these out, I'm sure you will find some activity on most. Also, you can contact the FCC to get thePDX current freqs for all four altitude zones. Monitoring America has a great section too, but it is spendy.

I suspect what you are describing is the "IFB", for interruptable feed
back signal, which is used by most of the stations to allow their remote
personnel not only hear what is going on the air, but to get instructions
from the station, such as the cues you noted. Glad to hear KFI's freq.,
do you have any others of LA stations, especially the TV and news radio
stations?

Saw this on the wires... in light of the publicity this system has gotten recently, thought some folks might be interested...

PRESS RELEASE
FOR IMMEDIATE RELEASE
FEBRUARY 16, 1996

CITY OF PORTLAND, OREGON BUREAU OF GENERAL SERVICES
For Further Information Contact:
David Kish (503) 823-6825 Dennis Quail (503) 823-6971

PORTLAND RADIO SYSTEM PERFORMS WELL DURING TEST

Portland, OR - The City of Portland's new 800 MHz trunked radio system performed just as it was designed during a public test and demonstration February 7, according to City officials. Representatives from many of the agencies and other governmental entities using the new system attended the demonstration.

The City scheduled the demonstration of the Motorola SMARTZONE system following reports the system failed during the severe wind storm here on December 12, 1995.

"The City and Motorola have been working aggressively on the system since the December wind storm," says David Kish, Director, Bureau of General Services, for the City of Portland. "This demonstration was designed to simulate the level of calls disasters like the wind storm can generate. The severe rains we had the day of the demonstration gave us an additional challenge we hadn't anticipated. But, the system performed very well."

The system did experience some minor technical and weather-related problems during the December storm, says Joel Harrington, a senior communications engineer for the City of Portland.

"But, the system did not go down as media reported. City of Portland and Motorola engineers fixed the problems quickly. Some system users never knew there were any system problems at all."

Over the last two months, Motorola has upgraded the system's software and some hardware as part of the routine installation process. Those upgrades were completed the day before the public tests.

"The same day we completed those upgrades, we really hammered the system to see how far we could push it," says Harrington. "We handled 102,000 calls, 476,000 air time seconds. Normal daily traffic is about 50-70,000 calls. We were very, very happy with how well the system performed."

The system also performed well during the hostage incident at the KOIN Tower in early January, and a snow storm in mid-January. Both incidents generated call loads on the system well above those the City experienced during the December wind storm.

"The system was purposely designed to accommodate these unexpected surges in call traffic," says Harrington. "In each of these cases, it did just that without any problems at all."

One of the issues media reports raised last December concerned system back-up to ensure continuous capability.

"Our new system has significantly more redundancy than we've ever had," says Kish. "We actually have seven levels of back-up, all the communications system redundancy necessary to maintain our communications capability and protect personnel doing their jobs in the field."

According to Kish and Harrington, the bigger challenge is training personnel on how to use all the new system's many capabilities and features.

"This system is easily the most sophisticated we've ever had in the region, and everyone is still learning how to use it effectively," says Kish. "But, the most important point is the system works well. Motorola invested the resources to help us make sure it does. With their support and the hard work of the City's engineering personnel, we have a communications system that can grow with our needs well into the next century."

Steve says.....
>450.7250 is the STL (Studio to transmitter Link) frequency for KFI.

Not Quite....

The 450.725 is *NOT* an STL. 450.725 is a "cueing" frequency,it is used for cues only. The STL freqs are in the 950mhz range and are very directional(point to point). 450.725 is an omni signal and if it was used for STL then you would hear all the producers and board-ops over 640-AM.

This is not to say that 450mhz is not used for STL's in some cases...but not in this case.

The KFI STL freqs are listed on the "Percon" website.

Take care!

Mr.News,
(Who has a few friends in the KFI News Department)

: I have some problems with my 200XLT. Let me describe the symptoms:

: - I can only turn it on if I apply about 10 Volts for a second or so. After
: this, it operates like normal at the normal 7.2 V battery power. In the
: beginning, I could get it on by using the AC adaptor, which will increase the
: battery pack voltage just a bit. Over time, the voltage needed to activate
: the unit has increased to the 10 Volts it is now.

: - Some programmed channels/modes seem to need more power than others,
: sometimes even so much the unit turns itself off. Extremely annoying if I'm
: carrying it around and don't have the 10 Volt power supply to 'kickstart' it.
: I have to lock-out these channels or even the complete bank to prevent the
: unit from turning itself off.

: Can anyone shed a light on this? Can I repair this myself?

: --
: ST:CCG Card of the Day * http://www.metropolis.nl/~ldp/COTD.html
: --

It sounds like your PLL is going out of lock, and the CPU is sensing this
and shutting the unit down.
This could be anything from a lousy regulator to a major PLL circut
problem(if you are going to try to trouble-shoot this yourself(not
recommended),start by checking the VCO circut))
If the voltage is correct at the VCO, then the VCO is suspect.
If the voltage is off at the VCO, then look at the power supply circuts.
In a unit of this type look at the regulators and the filter capacitors.

3764. Re: Cassette Tape Greater then 120 min

It is my understanding that a tape (cassette) longer than 120 minutes
would be so thin that it would be subject to breakage.
The VCR idea sounds like the cheapest and easiest way to go.
Good Luck,
Ellison

>Good Luck,
>Ellison

Ellison, et al.,

I guess that I should jump back in here and thank everyone for their replies concerning my original post.

I probably messed up by not stating my main purpose for wanting a tape with a capacity greater than 120 minutes. My main reason was portability and it would be kinda tough totting a VCR around the house or while jogging/walking.

Cheers

Brian

Its kind of expensive, but C. Crane company in Fortuna, California sells a machine called talk radio recorder. Uses standard 90 minute cassete to record 3 hours. Has a built in radio and mic. Runs on ac or internal batteries and you can even even get an adapter to play through you car tape player. Hope this helps.

If you can find information on MX-Com Integrated Circuits (like a catalog) you will find that they sell quite a variety of chips to do this very sort of thing.

Otherwise, Ramsey Electronics sells a kit to make one for about $40 (without case or power supply). This circuit was featured in a Radio Electronics article last year. Go to a library and scan back issues.

Want something better than a radar jammer?

I'm not sure of all the details, but apparently an Electronic Tech did something along the following line a couple of years ago. He took a 900 Watt Magnetron from a microwave oven, designed and build the necessary circuitry to hook it up to his radar detector. The effect was that once a radar signal was received the magnetron was switched on sending out a pulse that would blow the front end out of the radar guns.

3777. Cheeky 4 Announcing a Big Cheek

Newsgroup: rec.radio.scanner
Date: 1996-02-17 00:00:00 UTC
From: an519923@anon.penet.fi
Message-ID: <041302Z17021996@anon.penet.fi>
Source record: 239833

Here ye here ye. Watch this space for the really big big new and improved Cheek. Including such items as:

Virtual Downconverting, I invented it, I was about to patent it and those guys at Cellular Security started using it without my permission. I'm so mad I could flame.

How I made Fido net safe and usable when Stormy took a powder. Yes, I saved the day again!

With an introduction by Ken Storm who in addition to thanking me for taking the helm when he jumped into the sea has also credited me with the design concepts found in most modern scanners manufactured since the 1986-87 PRO-2004.

With a lengthy explanation of just why I get along so well with everyone. My former partners have made up with me and now acknowledge that they were jerks and I really was a nice guy after all. The new upcoming updated computer interface for the GRE manufactured scanners is now announced. Not only that but I am such a nice guy that I will give away the schematics!!!

And last but not least - all the folks who order this new Cheeky creation before it is published will get a copy of the companion book - The Moss letters. This is a collection of the best of my missives and missiles to and from Andy Moss. These are culled from the best of our Fido, E-Mail and Usenet posts. Along with this I will also include my just pressed CD including every item I have ever sent or received from my pal Andy. This will show the real Cheek and the real Moss. There is nothing growing on these stones and when you see that the whole mess was just in good fun (see E-Mail Chapter 3 , message 16) you will be in on our inside joke. WE REALLY LOVE EACH OTHER!!

So watch this group and see just how Cheeky things will get with the new and improved Cheek 4!!!!!!!

Sorrrrrrrrry folks. No mods this time. The next mod book will be Cheek 5 or Cheek 6.

I know of 3 sources for audio scrambler/descramblers.

1. The Fall 1994 issue of Electronics Hobbyists handbook (put out by Popular Electronics) has a construction article with schematic on building an analog version. A kit of parts is available from Weeder Technologies, P.O.Box 421, Batavia, OH 45103 for $29.00 and the pcb for an additional $14.00. Or get it fully assembled for $69.00

2. The December 1993 issue of Electronis NOW has a construction article with schematic on building a digital version. A kit of parts is available from North Country Radio, P.O.Box 53, Wykagyl Station, New Rochelle, NY 10804 for $59.00 plus $3.50 S&H.

3. Ramsey Electronics (1-800-446-2295) has model SS-70A Speech Descrambler/Scrambler as a kit for $39.95 plus $14.95 for a case. Or fully assembled for $79.95 plus $4.50 S&H.

Happy scanning.

3784. *** How to make the AR3000 IF more narrow ? ***

Newsgroup: rec.radio.scanner
Date: 1996-02-17 00:00:00 UTC
From: Marc Gauw <marcgauw@simplex.nl>
Message-ID: <4g428i$qk0@news.simplex.nl>
Source record: 239890
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I know that it should be possible to make the IF
of a AR3000 (normally 12 Kc for NFM and AM) more
narrow (4.3 Kc). This gives improvements in especially
Shortwave and Airband reception.
I know that firms like Bogerfunk (Switzerland) are
advertising with this (Deutch-Mark 150,-).

Only I like to do it myself, and preferably for free !

Therefore, maybe somebody knows the following :

* Is it possible to modify the IF of the AR3000 just by
a switchable exchange of the current the SSB filter (4.3 Kc)
and the normal IF filter (12 Kc) ?
Or do I have to buy new extra filters ?

* Could somebody mail (marcgauw@simplex.nl) or fax me
a swithing diagram how to do it myself ?

>I think Marti also made a STL system.. (studio to Transmitter)

That's a pretty good description,but let me add to it....

Most "Marti's" are Wide band FM and run an average of 25 to 50 watts.
They are designed to operate continuisly. Transmitters and recievers are
seperate units and can be rack mounted(about the size of a suitcase).
Most stations prefer to use directional antennas(yagi's) to the recieve
site. Marti's usually have only one or two channels,but since it's been
a few years since I used one,they probably have a systhesized(sp)unit
available by now. Marti's *CAN* be used as STL's,but 900mhz STL's are
the "norm"these days. I do know of one station in Monterey,Ca. that used
a Marti as an STL for a couple of years. Many stations are now switching
to ISDN for remote links because of extra voice and data channels.

Thank you, Mike, for elevating a simple discussion of the price of a well known piece of monitoring gear to the usual high level of discourse for which you are so reknown. I'll pass on playing your typical flamewar game. You did it on GEnie and you've honed it to perfection here in supporting various scams over on rec.radio.swap. My experience with your actions over there alone would give me pause in trelying on just any off the wall number you quote as a "fair price". But, in the interests of all of us who are consumers, I urge you to post a full and complete, unedited copy of your highly vaunted (supposed) database whic lists all the "actual sale price" scanner transactions you claim to have documented. Don't do just the R-7000's Mike; give it ALL to us, OK? I'm sure you have it right at your fingertips and are glad to demonstrate your diligence and integrity. Now, it WILL have names and dates so we can check it for accuracy won't it Mike? Come on, Mike. Put up or shut up. Inquiring minds want to know.

: Morriseau's price "advice" is pure opinion and has no basis in reality. I

I'd say you have a little trouble with reality yourself. There is no
such radio as the ICOM R7000-2. There is, however, a R7100-2. As far
as the R7100 being more capable, that is debatable. The R7100 covers
25 MHz that the R7000 does not and it has a few more bells and
whistles. I would rather have an R7000 with it's (mostly) continuous
coverage than a crippled R7100.

BTW, I do own an early model R7100 and would not even consider taking
$1000 for it.

BEWARE OF DELAING WITH DERRICK HALL OF SEATTLE, WASHINGTON!

On November 17, 1995 I sent him a money order (as he and I agreed) for a PK232. He claims to have sent the package but that it was returned. I assured him that the address in my letter that accompanied the money order was correct (a mail center) and to resend the package. As you dear reader, have guessed by now, no package.

I have called Mr. Hall on 12/1, 12/11, 12/12, 12/13, 12/17, 12/18, 12/19,12/20/95, 1/2/96, 1/15, 1/22, asking for either PK232 or return the money! No money, no PK232.

He sent me this message:

*** Forwarding note from DERRICK --PB1 01/22/96 16:05 ***
"To: jcscott@PacBell.COM

Subject: NOTE 01/22/96 16:05:00
I Got your message, that you call this morning. I sent your Money order in the mail on friday, I think it was after 5:00 when the mail stops up here so it should have went out on saturday. It does not matter if you try finding my employer be cause I am the employer so if you wanted to say someting you could call me up. Why do you think i be gone so much. Well anyways your money should be comming with in a few days. And don't call me back!!!!!!!"

I attempted to respond with:

"Subject: NOTE 01/22/96 16:05:00
Derrick
I have called and paged you numerous times with no return call. Specifically I called and left messages on 12/11, 12/12, 12/13, 12/17, 12/18, 12/20, 1/2/96, 1/15, and 1/22.

I originally mailed you the money order on 11/17/95 so you can see why I upset about "no communication" from you, no PK232, and no returned funds.

When the money shows up I will cease to call and bother you.

NOTE 01/22/96 16:05:00" F

My response to hime was rejected. The postmaster on his system responded with:

" Subject: Identify User
Your email to Derrick Hall is being rejected because he has run out of credits. When he purchases time, he will be able to receive email again."

I called Mr. Hall again on 2/6 and 2/15, same results, no money, no PK232. On 2/15 I offered to mention his business practices on the net and this note is the result.

If any body in Seattle reads this and employees this man (I think he is an independent contractor) be sure you are getting good value for your time and money. He is not very honest in his dealings on the Internet.

There is a difference between Kmart and Radio Shack. Both
companies sell products of average to poor quality. Both have poor
service and sales clerks that lack product knowledge. However,
Kmart's prices are low and Radio Shark's prices are rather high.
Kmart sells a number of brand name products. Radio Shark sells
"off-brand, private label" stuff.

This Yupiteru MVT-7100 is a top performer portable unit with excellent specifications:

* 530 KHz to 1650 MHz
* Wide FM, Narrow FM, AM, LSB, USB
* 30 channels/second

Has optional leather case and nicads. Like new in original box and paperwork, works great, $475.00.

Better audio, sensitivity, and quality when compared to the AR8000 but no computer control (I've had both) and original price over $700 with all options. Now $475.00..

It would help if we had the state, or at least the country. A check of two atlases provided no clue. However, assuming it's in the USA, the reference to 500 and 508 MHz frequencies would appear to indicate the Philadelphia metro area. The range covered by TV channels 14-20 (470-512 MHz) is available in certain large metro areas, and Philly has Ch 19 & 20 allocations.

In the UHF-TV shared band, mobiles are 3 MHz above the base, so for the frequencies mentioned:
Base - 500.4375 Mobile - 503.4375
508.4625 511.4625 (511.4265 was probably a typo)
508.4875 511.4875
The 508 MHz freqs. are drawn from the General Access Pool, so the best place to look for additional channels is 506.3125 - 508.9875 MHz. Since assignments are usually made in asscending order, at 25 kHz steps, check 508.4125, .4375, .5125, .5375, etc. In particular, it would appear that 500.4375 may have been a typo for 508.4375.

Price is now $450.00 US plus shipping.

The MVT 8000 is 200 channel ac/dc scanner with a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired.

It covers 8 Mhz to 1300 Mhz (continuous without blockage) and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz.

It's got a 10 band search function, pass memory function, and other goodies found in high-end
scanners.

You must not have much experience in dealing with him. Nice person? Well,
if that includes
sending people thinly-disguised threats via email, as he has been doing to
me , then I guess he is. According to Mr. Cheek I had better be "keeping
an eye out", because "interesting things will be happening right down (my)
alley." He also included a poem (a very bad one at that)
about incest which he was kind enough to include in his letter.
Nice guy? You decide..

Tim Bono said,

-> Hello Everybody,
-> In my truck at work I have a Motorola MDT8100 terminal and a Bearcat
-> 560xlt scanner about a foot apart, and whenever the terminal goes
-> into screen saver mode the scanner locks up on vhf-low channels with
-> heavy static. Does anyone have any ideas for shielding the scanner?
-> I cant move them apart and I cant turn the terminal off.

Contact the radio repair company that maintains the 8100, there is
additional shielding that can be done to the MDT. Also it is important
that they use a ferrite choke on the power cable to the MDT and ALL
equipment be grounded/bonded to the vehicle chassis. This has taken care
of some similar problems I've seen.

3832. AR8000 audio clipping/narrow I.F. mod

Newsgroup: rec.radio.scanner
Date: 1996-02-18 00:00:00 UTC
From: klimasewski@fccvde.enet.dec.com
Message-ID: <4g8ccc$427@mrnews.mro.dec.com>
Source record: 239745

With all the talk of changing the stock I.F. filter to one thats wider
(to solve the audio clipping problem), I wanted to mention how it
will effect AM reception (shortwave,aircraft,etc.) The same filter
is used for both NFM and AM. If you widen the NFM you will also widen
the I.F. for AM. This is already a problem with the stock filter.
Shortwave stations are to close to each for such a wide bandwidth.
Due to the I.F. bandwidth being to wide, weak shortwave stations
that are close in frequency to strong ones will not be heard or both
will be heard at the same time.
This was a problem many users of the ICOM R1 complained about.
The ICOM stock filter used for NFM and AM has a bandwidth in the
area of what would solve the audio clipping problem but would be
to wide for shortwave reception.

I beleive the mod I have come up with will be a must for those
that do change the NFM/AM filter in an effect to solve to the audio
clipping problem or want to have improved reception in crowed
shortwave bands.

I have designed a switching scheme that allows the user to select
the stock 12KHz AM filter or the narrow SSB 4.0KHz while still in
the AM mode. I have found this to make a BIG difference when trying
to receive a weak shortwave station next to a very strong one.
The only part required is a switch and some wire.
My mod has no effect on the use of the DS8000 speech inversion accessory.

Send me email if interested.

Source record: 239748

desense is caused by strong nearby transmitters. It will not be cured by using a broad-band antenna like a disk-cone. You need to move away from the strong transmitters or try to build or buy a filter to remove their strong signal from you receiver. An antenna that is tuned for the frequency you wish to listen might help depending on how strong the desensing signals are. Hams have the same problem on two meter moble on RT 270 in Maryland. There is a club that has developed filters for the specific problem frequencies. I think it might be caused by a strong UHF TV transmitter near RT 270. Email me If I hear more I will send you info. The problem is that the filters would have to be custom made for the interferring frequencies but maybe the design can be modified for your use.

I've found the Radio Shack PRO-46 to be a good scanner for under $200.00, and it has 900 mhz. The only problems I've had is the display is hard to see, and it's too easy to accidently push a button (and lock out a bank of channels) when putting the scanner in your pocket.

For immedeate sale:

- Icom W21AT Dual band handheld with 50-999MHz recieve
- Two BP-157 battery pack with built-in whisper mike for full duplex
- Wall charger
- Manuals and schematics

I used this radio only for Rx at home (nice for it's wide coverage), but I just got a new base scanner that does the same job with more 'scanning' features (more memories, but no cell...). I need to sell this radio to pay off the scanner bill that will be coming in the mail any day now. Everything is in like-new condition, no scratches or markings of any kind. I'd like $400 for the lot, but the best offer will get it. Also, to fastest offer will get it!

Thanks,

Dave

[snip]
>Any comments?

There are some fundmental reasons why you can't compare adding a second
cellular phone (by cloning) to adding a second phone in your house.

Cellular is a radio service. Your rates are based on access the network.
You don't pay for a "line" to which you can connect as many phones as
you wish. You pay for one cellular telephone to access the network.

For practical purposes, the wireline bell telephone companies don't care
about how many extensions you have on your home phone line - ON YOUR SIDE
of the demarcation point (demarc) out side your house. They are only
responsible for the service up to that demarc.

If you want your line to appear on a phone somewhere across town, you
have to have the phone company do it - and they charge you for it.

In the case of a cellular telephone, the "demarc" is the transceiver
itself. The cellular carrier is the radio system licensee/operator and
they have effective control over your cellular phone. If you want that
number to work in another location (another cellular telephone - which is
a radio) you have to have the cellular phone company do it. And they are
within their right to charge you for it.

So you would be defrausing the cellular carrier of legitimate revenue by
cloning your car phone and making it appear as your hand-held.
Especially if the carrier offers "second phone" services that are
billable.

Cellular is a radiotelephone service - a glorified trunked radio system
with interconnect to the public switched telephone network. It is just
not the same as wireline telephone service. It has it's own set of laws
and rules.

I am surprised that we are still seeing ads for shops that appear to be
cloning phones. Cloning is expressly prohibited by FCC rules.

L >
L > Nope, this is not the problem I still have. :-(
L >
L > My problem still persists if I connect my scanner to a regulated
L > power supply instead of to the battery pack. It won't switch on
L > until I apply 10 V for a second.
--
I hooked up a power supply to my 200XLT and found that it "powers on"
at about 5V, and reducing the voltage, it cuts out at about 4.5V
(that is, applying the power directly to the scanner, not the power
pack). Interestingly, turning up the power slowly wouldn't activate
the circuit, even going in excess of 12V, so the power has to be
applied suddenly, which would suggest that there has to be a voltage
differential present somewhere, which may not exist in your unit
unless you "shock" it with 10V.
Other than comparing regulated and unregulated voltage path values
with those given in the service manual, you may want to temporarily
hook up a larger electrolytic capacitor parallel to any one in the
power-regulating circuit to perhaps create a greater potential
difference, which may then kick-start the scanner.
```

The BC9000-XLT has non-volitle memory to store your settings and frequencies...meaning you can
shut it off, and/or unplug it without the fear of loosing those settings...ever!

It really wound be a panic if you had that fully programmed and lost it all!!! :)

Now you can sleep.

> for places that will program 2 phones on one cellular number. Why can't I do that
> myself?

...snip snip...

> Anyway, I'd just like to know if this can be done, and how?

Yes there are two ways it can be done.

The first, and more desirable way, is to be fortunate enough to live in
the service region of a cellular carrier who offers legitimate,
2-phones 1 number service. SNET in Connecticut offers this under their
"Duo" plan. Unfortunately, to get this service you have to relocate to
Connecticut.

The second way is to change the ESN (electronic serial number) of your
extra phones. This is possible with many cell phones, but ususally
isn't easy. It's also illegal, however, if you are using a so-called
"modded" phone for your own account and not to commit fraud you can be
reasonably sure the feds won't be breaking down your door anytime soon.
You also cannot use both phones at the same time, in fact, merely
turning both on at the same time will usually result in your account
being suspended.

Does anyone have the frequencies for the Oakland County Jail (radios inside facility) in MI? I looked in my copy of Police Call but couldn't find the jail.

Thanks, Neil

3853. F1 racing team video

Newsgroup: rec.radio.scanner
Date: 1996-02-18 00:00:00 UTC
From: Two-Dogs <why@do.you.ask?>
Message-ID: <4g64p7$71t@oznet03.ozemail.com.au>
Source record: 239843

Does anyone know the frequincies used by the on-board cameras used by the racing teams? I'm sure this is country specific, as the equiptment would be supplied and installed by the appropriate TV station responsible for the race coverage, but if anyone knows the usual band for these, and other portable RF video links (EG at other sporting events like golf etc) I would like some hints. Thanks.

TD.

Here's the info on the AR8K mailing list. It's quite specific to this
radio & its usage and modification. There is presently discussion on IF
filter swapping.
Short answer: It's possible & easy. The filters come from Murata in
Smyrna, Georgia, USA

Considering price vs performance, they are worth about $150.00 used.

>talking on an answering machine, saying something like
>"Bob, call home when you get a chance".

That is what paging used to be like...

The one you are hearing is called "tone & voice" because the pager
both beeped and then you could hear the voice of the caller for a
short period. The two tones would activate resonant reeds or active
filters in the pager, which would beep then open squelch to the
speaker.

Of course all the new ones use digital messaging. A big reason for that
is channel usage - to get a voice message across took up to 10 seconds
(including signalling), while now the digital message takes much less than
a second to transmit. This means that many more pagers can be placed
on the same RF channel with digital.

This is flat out incorrect! Cordless phones, base and handsets,
transmit/receive of freqs between 43.72 to 49.97. I don't have the time or
even the inclination to list the entire 25 channels--base and
handset--that cordless phones use, but perhaps someone else will do it.

Unless you have a reciever *and* are in-line with the signal you will
be pretty much out of luck.

I don't have the specific freqs handy but look around...

2ghz Portable ENG,newsvans and helos 7 channels

6 and 7 ghz fixed links/old newsvans

13 ghz short hop fixed links/"shoebox" portables

28 ghz fixed link/short hops

There are a few more areas,but these are the most common.

Durham has them indeed, but the price is much more than what you might
suspect. I bought an OS535 from them at $319, but the final bill was
closer to $350. After telling me that the interface would be sent by
regular post (which took two weeks) at the usual postal rates, I found out
too late that they jacked up the price by $30! On top of that, you are
likely to get hit with customs fees, which for a 2006, I guess will be
around $20. That $379 scanner suddenly becomes a $450 scanner! Well, I've
lived and learn and I suggest that if you do business with Durham that you
press them for the precise price to avoid getting ripped off like I did.

Just recently purchased a tr-4500(ar-2500 clone) and am reasonably
happy with it now that i'm used to its peculiarities. Has an
interesting scanning/spectrum display/logging computer interface.
Semms to be old Klingon technolgy but sure beats the price of the
other
computer controlled radios on the market. Am also currently operating
a Pro-2006, DJ-580(dual band ham HT),a bearcat INF5xl< and a Pro-4.
The Pro-4 is one of the first handheld scanners sold by Radio
Shack,circa 1970,and still performs with the best if you dont mind
buying crystals. Also have a pretty comprehensive freq database for
the Nashville,Tn area.

> KC7NIY--CHUCK
> 73'S

Listen to a new world technologist's attitude that's shared by most:

I'm an electronics engineer, a member of the IEEE, and a computer
network architect. I like radio and analog electronics as a hobby.
I use the 2M band on a regular basis and that includes auto patch
and repeater services. I do not have ANY KIND of FCC license although
I might get one if I have the time to waste. One thing is for
sure:
I WILL NEVER TAKE A TEST ON MORSE CODE!!!!!!!!!!

What kind of a BONEHEAD is so obsessed with HISTORY that they seek
to make modern electronics professionals and hobbyists learn the
trade of the old telegraph operators of the 1800's? In terms of
electronics knowledge I have regularly WAXED every "amatuer"
radio operator that I have ever met and all they can do is try to
hold this childs toy morse code thing over my head. Gimme a
break man!!! That CRAP IS DEAD!!!!! It serves NO PURPOSE!!!!!
Don't even try and argue with that - YOU WILL GET WAXED TOO!!!!
Let's face it, in the 1990's it's outdated to even use HF for voice.
This is the age of DATA COMMUNICATIONS. I would like to invite
all really fast morse code guys to come over and try to beat the
speed of my terminal adapter at 9600 baud. And for those who
want to say things like "but what if, in a really bad disaster,
you didn't have your TA?" Do I even need to get involved in
such a pathetic arguement? NO!!
Now, to change the subject a bit, I don't ever want to be called
an "amatuer radio operator" - what a pathetic label. I got my
general class professional ticket while I was in the Navy, so how
am I supposed to be called an "amatuer" - really weak label. And
as for being called a "Ham Operator", I'll never be a HAM.
I've been extremely successful as a designer of TCP/IP networks
and recently became a Cisco Certified Internetwork Engineer to
boot, so, maybe with all that extra cash I'll pick up an HF radio
for home and another for the car, hook up some TA's and have
a roving data terminal, NATIONWIDE!!!!! One thing that will never stop

me is MORSE CODE!!!!!!!

From: lancecr@msn.com
Message-ID: <00001ff6+0000477d@msn.com>
Source record: 239860

I'm looking to spend less than $200 on a handheld and I'd like
oppinions on what to buy.
I'll be using it to listen to police, fast food, security, cordless,
etc... I wouldn't mind full 800MHz coverage, but I don't expect I'll
get that for less than $200. I would consider non-US versions for
full 800MHz. I would like it to be small enough to be easily carried
around in a pocket (without looking like you've got a thermos in your
pants.) I've considered a Bearcat SC150 - is there a non-US version
of this unit? Should I consider a Radion Shack unit?

Thanks for comments
Lance

One way to avoid these types of deals is to have the possesor of the
equipment send it COD. At least you get a package (no telling what's
in it) and the sender doesn't get any money until the package arrives.

I have purchased several things this way and, fortunately, have
gotten what I paid for. There is really no way to judge the character
of individuals who sell through the postal service.

Planning on buying a portable scanner.
Have pretty much decided on the AOR AR8000.
Question is, what else is comparable (or better!) for the price?
I like what I read about its features (all the bells & whistles),
but may not necessarily need LW, MW, or HF coverage, as I already
have a portable shortwave.

Any advice appreciated.
Thanks
-Jon

I am unsure of the law in Ohio which pertains to carrying scanners in cars, but being an amateur radio operator I feel I'm well within the law.

I don't feel that scanners help you avoid very many tickets, but they do produce advance warning to emergency vehicles that may be coming in your direction. They also help you in avoiding delays due to automobile accidents.

I primarily use my scanner to monitor local railroad activity. My hometown is the crossroads for three major rail lines. On many occasions this monitoring has helped me avoid many lengthy delays that may have made me late for work!

If you have any idea what the law is for Ohio pertaining to mobile scanners, please post or e-mail me. Thanks

> I quess I need to throw my two cents in. I am amazed what some
sales person will say to get a sale. Since I have an electronics degree
and work with computers, I feel that I know a least a little.
Since I travel the Northeast for work, I stop in R/S to kill time
and to pick up 5 & Dime Items, such as solder and Caps. To check out
how much the sales person knows I ask them a simple question.
What does the RG stand for in the Coax, (ie RG-59, RG-6 and so
on). You would be amazed the answers I get. But the most popular one is
that since Radio Shack sells only the best it stands for Really Good (the
best coax around). I have to hold back my laughter.
For those who are interested RG stands for Radio Guide, that was
the term given to the wire before it was called Coax Cable.
I once put in a application at a local R/S for the fun of it.
The store manager told me that they did not need anybody that knew
anything they wanted people with Sales skills. (?)

Hi Jimmy,

> As of Jan-1995 the FCC ordered all manufactures of scanners to
> completely block out the portion of the 800mHz band that is used by

I think your dates are a little "out" :-(

27 Oct 1992 (From memory) your then President Bush signed some legislation
that stated that within 180 days new FCC Rules that would not allow
800MHz cellular frequencies to be covered would be brought into force.
This meant that after the 26 April the FCC would no longer approve any
scanning device that US Cellular frequencies or "could easily be modfied"
for cellular receiption.

For equipment to be sold to the Public it has to be FCC approved.

The legistlation further stated that beginning 1 year after the 26th
April 1993 no scanner could be manufactured or imported into the USA -
hence the 26th April 1994 became the date that 800MHz cellular scanners could
no longer be imported.

Equipment that was FCC approved prior to 26th April 1993 could continue
to be imported until the 26th April 1994 and also be sold after the 26th
April 1994.

>
>Where was the bias??? I posted *DOCUMENTED FACT* ie:"the use of
>documentary evidence" are court transcripts a document? Is a videotape a
>document? Is a hard copy of my posted article a document?

The remark in question was,
"drugged drivers cause as many accidents if not more than drunk
drivers."

The evidence cited to support this claim was partial mention (i.e. no exact
Who What When Where Why) of four (4) incidents, and NO references to any
specific sources of the info. Assuming that this is the best you can do,
you have DISproved your thesis, since there are lots more than four
accidents caused by drunks over the same time span.

Documentary evidence for a claim like this would probably consist of
- The total number of accidents caused by drugged drivers in a
particular time frame, with either a detailed description of how you did
the original research to determine this OR a bibliographic citation to
the published source you quoted from.
- The number of accidents due to drunks in the same period, with the
same kind of support.
- Subtract the first number from the second.

No number of annecdotes that you can post in a newsgroup are going to
have any relevance to the relative rate of occurance of the two kinds of
accidents.

No Barry it's 25 channels here. I don't even know why you answer these questions. Obviously Marcin is writing from North America and is asking for the 25 cordless phone frequencies. You of all people should know by now that North America and Australia have different frequency allocations.If someone asks for the Australian cordless frequencies we don't answer that 30.XXX MHz is wrong.

Well, I have the AR8000 & love it! Of course, ALL scanners are limited by
the antenna connected to them. The $100.00 DX conversion mod to allow a more narrow
AM filter is something to consider (EEB in Vienna,VA does this). I have ,
nevertheless, been quite happy with it! Nothing comparable in a handheld exits on the
market. The similar Yupteru model has no provision for a computer interface. -David.

I used to work at radio shack (about 6 years ago).. I was the tech person for the store I worked at as well as some of the other stores that needed assistance. Taking those tests mean nothing.. when I worked there, we were allowed to take the book and the test home and take it then it would get sent to the district office for scoring.. in fact, the manager of our store highlighted the correct answers (although some of them were wrong)...

the reason why I dont work there anymore is simple and its probably why not many tech people work there is because of the $$ they pay and the quotas they set... I remember our store getting yelled at by the DM for out numbers..

SUBJECT: LAFD WEBSITE...NEW URL & UPDATE
Effective 02/12/96:

The Los Angeles City Fire Department Website has (finally) been updated.
Included in this update are:

-an overview of the LAFD's Swift Water Rescue program.
-a glimpse at the LAFD's new Heavy Rescue Utility.
-a comprehensive listing of Fire Department Services.
-a couple of new photos of the LAFD in action.

Lot's more is on the way...and the Webmasters who maintain our site on
their off-duty time are appreciative of your patience.

We also have modified our URL...you can now shorten the word "department"
to "dept".

The "old" URL will connect with our site equally as well, but for those
of you who are interested, the new URL for the

LOS ANGELES CITY FIRE DEPARTMENT:

http://www.ci.la.ca.us/dept/LAFD/index.html

If you have a chance drop by. Your comments are anticipated and (unless
we somehow manage to hire a megabuck research firm) SINCERELY appreciated.

Stay Safe!

Brian Humphrey
Public Information Officer
Los Angeles City Fire Department
200 North Main Street, #900
Los Angeles, CA 90012 USA

: This is flat out incorrect! Cordless phones, base and handsets,
: transmit/receive of freqs between 43.72 to 49.97. I don't have the time or
: even the inclination to list the entire 25 channels--base and
: handset--that cordless phones use, but perhaps someone else will do it.

It's flat out incorrect only if you're talking about US cordless phones.
Cordless phones in Australia certainly do use 30.xxx frequencies. (Look at
Barry Grady's email address closely.)

Once upon a time, US cordless phones used frequencies just above the AM
broadcast band (wonder if any of those are still in use?).

I'm sure Barry Mulligan's posting from his FAF file is around here somewhere,
anyway, if you really want to know the US frequency allocations.

I'm looking to add a multi-band scanner antenna (30Mhz - 900Mhz) to my car (station wagon with LOTS of ground-plane area!!).

The thing I would like to accomplish is to keep it under 24" in length so I don't destroy my new garage doors every time I pull the car in. I know this may be a dumb reason to some of you, but the less painting I have to do, the better :-)

I'm willing to try and experiment with making one or if you know of one that already exists, great.

Any help is greatly appreciated. Thanks. (e-mail is appreciated too).

Mike

: Seems like this would be possible if the same bandwidth is being used.
: B.
:

I was messing around with the SAP function on my VCR the other day.
Seems like there were about 4 or 5 TV channels which made the SAP light
come on. Trying to listen to the SAP, I have concluded that SAP merely
stands for "Same Audio Program", because that's what all the stations
were presumably broadcasting on their SAP. Just a duplicate of their
normal TV audio. Perhaps the stations are fearful that ignorant viewers
will punch the SAP button and not know what it's for, and they don't want
to lose audience because of this.

I was not able to find a SAP which was different from the normal audio
programming.

Is my experience with SAP typical?

NO_CODE TECHS I HAVE KNOWN

ART -- designs ATV and antennas and much more from scratch! I mean down to the component! Equips helicopter avionics.
TED - A professor at UCI (no electronic background -- now a general) A worlds leading authority on the Ancient Greeks
BILL - Designed his own cavities for his homebrew 6M repeater (see QST)
JOHN - Former head of a Hewlett-Packard Division (one of the best)
FRANK - A decorated Marine Corp Jet Pilot, now in ARES
PAUL - Vision impaired -- knows more about VHF/UHF than many, now in NTC
JEFF - Drives a truck probably makes more that u and I, knows computers inside and out

Could site many more.

THESE FOLKS HAVE ENHANCED AMATEUR RADIO GREATLY.

Nuff said ??

Rod with a different perspective to the whining going on here.

>face-to-face english language conversation,,

More'n likely, it's the poor fellow whose expensive antenna is more a phallic symbol than a physical tool by which to accomplish a physical task to a certain criterion. Some people use their possessions as prosthetic devices for dimunitive or missing members of their anatomy and get emotionally charged when threatened with the idea that theirs isn't the biggest or the bestest.....

> you dudes probably violently agree on tv antenna costs, quality,
> and the original poster, now forgotten im sure is quite amazed
> by the short flame war.

Probably wondering what the hell he ever did to start all the ruckus. But yeah, some people feel there is no comparison between a $250 product and one that costs $75.

> All that aside i think i have a more technical yes or no
>question (well maybee not. One assumed need for this hi-gain scanner
>antenna is surfing cellular radio.

Which is illegal, by the way. And not long to last since cellular is going digital righteously soon enough, but anyway.....

>Is a beam/unidirectional technology really a good match.

Yes.

> How could you use it effectively since the mobile
> targets are moving,

A directional beam would be an interferant ONLY when the mobile moves along a lone perpindicular to the azimuth of the beam. That would give the greatest rate of change of angular displacement and could be testy to the operator, if the mobile were close. But at any distance from the antenna, it is not really a problem to keep beamed in on a target.

> and you really would want to hear as many fixed cell-sites as possible,

You do? Well, first of all, mobiles are in the 824-849 MHz band while bases are in 869-894 MHz band. Bases don't move around like mobiles. And you don't usually listen to the mobiles since they're so low

powered. It is real easy to keep a beam antenna pointed at the bases. And when you do, you're pretty much pointed at the mobile, too, since he's got to be in the same cell as the base.

> and omidirectional antennas would seem to be the best fit.

Why do you propose that? An omni 'hears it all'. This is ungood for NFM sites dispersed around the azimuth where where one signal completely overrides a weaker one on the same frequency. An omni antenna offers the operator no control over what he hears. Assuming you have a cell site north of you and another south of you, each on the same frequency(ies), you're only going to hear the stronger of the two, thanks to the "FM capture effect". If these cell sites change their power, then you might alternatively hear one site, and then the other throughout a session, and thereby become terribly confused and pull your hair out.....

If you used a beam antenna, then you could choose which sites to monitor and which not.

Furthermore, a scanner site is much more efficient as a receiver than a mobile cellular phone. This means you will be bombarded by a number of base cellular sites from many azimuths, but only the most powerful will get through, NOT necessarily the one that's most powerful to the mobile, which is used by the MTSO to control things. Any "surfing" you do will be random, haphazard, and totally unscientific with respect to who you listen to and for how long.

> If "cheep discones" provide limited improvement, what is the
> best option for this portion of the spectrum?

The best option for the serious scannist is two antennas fed into a low-loss coaxial switch. One should be an omnidirectional antenna such as a discone, for casual monitoring. The other should be a directional beam, whether log-periodic, yagi-uda, or a TV antenna mounted in the vertical plane, is up to the user as dictated by his needs, interests, and budget.

When entering a frequency, press "." before the first digit.
This will bypass the firware sanity checks and let you enter
frequencies outside the normal tuning range, e.g. 175 MHz.

Be careful -- If you stray too far, the PLL won't look up.

There's a jumper wire inside the K100, K500, M100,
M400, and other older Regency models which you can
cut so you won't have to enter the initial "."
Sorry, I don't recall the jumper location.

Ye public notice!

Know how in my books and other writings, I always recommend the old Radio Shack "LAN cable, 278-776" as the peak of perfection for hookup wire? Well it is! I don't know why RS called it "LAN Cable", but the stuff comes as 25-conductor, shielded cable.

The thing is, the 25 color-coded wires make for the absolute best hookup wire you ever saw!! The individual wires are *super-flexible* and the insulation doesn't melt and drip like candle wax, when soldered like Radio Shack's standard offering of hookup wire. To retrieve the wires, you just slit the outer jacket a little; peel it off; slip off the braided shielding, and there you have 25 uniquely color-coded wires that are pure joy to work with! And high reliability, too!

This 25-cond cable was in the stores for several years but has been discontinued for some time. Bummer! However, take heart and great cheer, because a fellow I know bought out a large stock and is offering it to hobbyists for $0.25/ft plus S&H. This fine cable used to cost $1.19/ft in the RS stores, so it is one helluva deal! Now a couple bucks worth will give the casual hobbyist more of the best quality hookup wire than can be had anywhere for much higher cost!

This stuff is really THAT good and is optimum for hackers and casual hobbyists as well as pro's. You've got to try it to see what I mean!

Voice: 800-859-6004 (8am-5pm, CST)

Mr. Peters acquired several hundred feet of this 278-776 cable and knows where to get an additional 1000-ft, if needed. I go through this stuff like water, but the casual hobbyist could get by for a long time with just 10-ft or less. Remember, there are 25 wires in the cable, so 25 x 10 = 250-ft. Mr. Peters' price comes to a penny per foot plus the shipping.

This is one of those truly rare, but absolutely great deals in Life. Take advantage of it if you're a hacker or experimenter of any kind!

Rgds,

Bill

3928. Re: Mystery Signal in Boston area.....

Newsgroup: rec.radio.scanner
Date: 1996-02-19 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <4gaiet$q68@hopper.acm.org>
Source record: 239704

pgeorge@sallie.wellesley.edu (PETER Q. GEORGE, N1GGP) inquired about:
> ... digital signal on 153.440 MHz in and around the Boston area.

Outside of the south-central US, 153.440 is allocated to the Power Service,
i.e. electric utilities (and possibly pipelines). Sounds like control or
telemetry for Boston Edison's distribution grid.

3929. Fast Food Freq in MD?

Newsgroup: rec.radio.scanner
Date: 1996-02-19 00:00:00 UTC
From: jamesb@clark.net
Message-ID: <4g9tm7$6d8@clarknet.clark.net>
Source record: 239705

I was wondering if anyone out there have any freqs to some fast food chains in the Maryland area. I live right next to a Mc D and BK

Any freqs will be appreciated.

TIA

I am looking for information on a Uniden BC60XLTB Scanner.

Freq. Range?
Is it any good for the money?
Anything else that may be helpful.

Thanks

During the Superbowl, the SAP channel had the play by play in spanish. At least
it was in the Chicago area.

>Stick to teaching music to the little kiddies in Portland Peter J. Boe.

I noticed good ol' Peter Breath whining about a poem I had sent him
via e-mail. I found it posted to me from an anonymous writer and sent
it on to Boe for his pleasure. Apparently he didn't like it. But
since he persists in fanning the flames, I've decided to post it here
for the pleasure of all. It seems appropriate enough. :

ODE TO PETER BEATER BOE
=======================
Attend to your incest,
that which you do best,
and give it a rest,
lest
you become the subject of jest,
and get pitched from the nest
for being a pest,
and sent west
with great zest
to infest
yet another test
of not exactly a love-fest.
C'est?

I've known Glenn Hansen for going on five years now. He has a track record of being helpful and contributory to a good running forum. It is no wonder that he doesn't answer your questions and certain others in this free-for-all three-ring circus where it seems perfectly okay and even the order of the day for a pure "nobody" to lash out and attack anyone with a credit or two to their name.

You and our fine feathered Peter Breath Boe jumped on me like stink on shit when I came here......and I did absolutely nothing to either of you to warrant your attacks. Moss had flamed me for a year here before I wandered in to face him up. You and Boe had no call to join in the attack on me.

Now Hansen has a word or two for Peter Breath and you jump in with venom of your own. Looks to me like the pot calling the kettle black, because you sure as tootin' don't help anyone or post any useful information beyond a token amount.

You're a fine one to be preaching hellfire and brimstone, sir. But suffice it for me to say that I've known Glenn Hansen long enough to know he's contributed immensely to the arts and sciences of hobby radio. You're quite misinformed if you think to the contrary.

Meanwhile, there is one undeniable fact that stands out ahead of all the rest........that our dear Peter Breath Boe does absolutely nothing for either this forum or Hobby Radio. You have contributed a token or two while dear Boe hasn't even done that.

And you are defending HIM? Boe is THE problem. Hansen is not. I am not. And for that matter, despite your style, you are not.

Let's get things into a crystalline clear perspective, if we may......

Boe is the problem. If Boe disappeared, there wouldn't be the slightest ripple on the pond. If Hansen disappeared, there would be a significant void..... If you don't know Hansen, and made assumptions about him, then even though understandable, you're off base.

I repeat again..... Boe is the problem, sir.

3937. Problem for "experts" in scanning and shortwave!

Newsgroup: rec.radio.scanner
Date: 1996-02-19 00:00:00 UTC
From: ukfan1a@aol.com
Message-ID: <4gaqn2$39i@newsbf02.news.aol.com>
Source record: 239713

I happened to be on the phone the other night talking long distance (neither person on either side of the line had a cordless or cellular phone) and all of a sudden 2 CB-ers (or what sounded like CB transmissions, maybe HAM) could be heard on the line. I quickly ran to my scanner and CB to turn them on, but couldn't pick up anything on the HAM repeaters, or the CB channels. Can anyone help me with this, or tell me what the heck happened?

3938. Ocala, Florida & Area Frequencies

Message-ID: <4gakqm$1ig8@usenetw1.news.prodigy.com>
Source record: 239714

Just relocated to Ocala, Florida over the weekend. I now have about 400 channels that need to be reprogrammed. (Okay...actually, it's about 340 since the fast-food, interant, and 46/49Mhz frequencies remain the same! <g>)

What do you have? I'm in the process of putting up outside antennas, so I'll be able to pull in everything from Ocala, Gainesville, and the surrounding area.

People have to start looking at where messages come from. Freq's are not
standard all over the world! The person who entered the message was in
Austrailia where freq's for cordless phones are in that range.

Peace from Canada, where cordless is in the 46mhz range. And 75 and 900 blah blah blah.

work in the FM radio broadcast band.

> Does
>anyone have experience with picking them up on a scanner?

You can't do that very easily on a normal scanner because most
scanners don't have a SCA detector built in even if they have a wideband
detector for receiving TV sound. In order for SCA to work, the band-width
of the signal has to be sufficient to accommodate the SCA transmissions along
with the audio.
support anything much above
>How do TV SCA's differ from (or are they the same thing as) the "SAP", or
>"Second Audio Program". Are there SCA signals which cannot be heard by
>by a television set's SAP capability?
>

To answer the second question first, yes. There are SCA transmissions
that can't be heard via SAP. This is because the new stereo sound standard
adopted in the early eighties allows for two SCA audio channels, one for
sAP and another for special studio use such as queuing. All of the subcarriers
are harmonics of the pilot tone which is the same as the horizontal sweep
frequency. The stereophonic sound is very much like that used in FM
broadcasting except that the frequencies of the pilot tone and stereo
subcarier are multiples of the horizontal sweep frequency.

>Are SCA or SAP signals done by having an addional FM carrier near the
>"normal" sound carrier of the TV signal. Or are they done by FM-on-FM
>modulation on the original sound carrier, which would require some type
>of modification to the scanner to receive?

You've got it right on the nose. The SCA signal might be thought
of is very high-pitched FM audio that is way! above a person's ability to
hear it. Not only that, but the deimphasis network and other filtering
placed in the audio output chain of a television receiver insures that
almost none of the SCA energy will ever reach the speaker. You shouldn't
hear any difference in the normal programming audio at all when a station is
broadcasting SCA.

Another use of one of the non-SAP channels is to send remote
telemetry from the transmitter site back to the studio so that the engineers
can remotely monitor the operation of the transmitter and do not necessarily
have to keep a live body at the site if it happens to be across town from

the studio. If you have a SCA decoder that tunes such a service, you will hear modem-like sounds which may have a cadence to them as the telemetry system cycles through all the parameters that are being monitored.

>
>And what types of things might be found on television station SCA's? Are
>the stations restricted to using their SCA for their own operation (i.e.
>queuing remote broadcasts), or can they lease the subcarrier to anyone for
>purposes similar to the SCA's of broadcast FM stations?
>

Since the SAP channel is included on lots of higher-quality VCR's and many television sets, nobody is going to put anything on there that isn't meant for the general public to receive. AS for the special SCA system, it is more likely not to be used at all or to be used for telemetry than anything that one would find really interesting.

The SAP channel is used for foreign language translation of a program such as when KTLA in Las Angeles reads the evening news in Spanish on SAp along with the English which is on the main channel. SAP is also used to provide something called DVS or Descriptive Video Service which consists of a voice-over during quiet parts of a film which describes the scene for blind people. Believe me, blind people enjoy television programs along with the sighted public and they should enjoy them more with DVS. Right now, there is not very much DVS since somebody has to be paid to sit there and do the voice-overs, but it is a good idea. It is sort of like an audio version of Closed-Captionning or CC capability.

I remember hearing many years ago that KTLA was doing the news in Spanish so if this isn't still being done, I am in error, but this is the exact sort of thing that planners originally had in mind for the SAP system.

I never knew that (I'm a ham, an electronics nut, and a scanner freak).
I'd venture to say that MOST hams don't know what RG means. Just like most
people don't know what BNC or N stands for, or for that matter, why the
batteries are named D, C, AA, AAA, etc. Kind of an unfair question to ask
a salesdroid (but fun to watch them squirm out an answer).

Here's one for you: Q: What size cells are used in a standard 6-volt
lantern battery (the ones with the springy terminals)? A: F-cells, there
are four of them (got this from a Radio Shack book, oddly).

I would, for example, expect an RS sales person to know the diff between
Narrow FM and Wideband FM, but not something as relatively obscure
(but great for Trivial Pursuit) as Radio Guide.

> I once put in a application at a local R/S for the fun of it.
> The store manager told me that they did not need anybody that knew
> anything they wanted people with Sales skills. (?)

Yep - hence the salesdroid syndrome.

Perhaps you picked the wrong hobby to develop an interest in? Like it or not, CW has been, is, and always will be the essence of amateur radio. BTW, the foundation for the word "amateur" comes from the French word "amore;" that is to have a love for the art (after Clinton B. DeSoto -- 200 Meters and Down).

Get an education, find a hobby you enjoy, and stop spreading your pessimism here.

-Paul, N9AZ

It can be easily modified with the assistance of a computer control program such as AR80000 ToolKit (available on the www) or by cloning another person's scanner. You will need the computer interface for the former and the correct cloning cable for the latter.

Not to be too picky, but is it that much of an inconvenience to
change a tape once in two hours? You must be one determined
jogger to not want to break your stride to change a tape.

>Radio Shack has the Pro 2040 on sale for $169.99.
> Is this a good deal???

That's fair. From the "Buying a Used Scanner" FAQ:

PRO-2040: late 1995 vintage 100 channel base made by
Uniden. Fair performance, but minimal image rejection.
Local oscillator harmonics account for spurious responses,
e.g., reception of cellular telephone calls in the 460 MHz
UHF-high band. Scans over 40 channels/sec. Can lock out
up to 50 channels from search. "Soft" on/off power
switching via keypad. See "The Radio Shack PRO-2040," by
Bob Parnass, AJ9S, in Monitoring Times, December 1995.

>Is there an alternative for about the same price that is a
>better choice??...

The Uniden/Bearcat BC860XLT has comparable features at about
the same price:

BC860XLT (Uniden): 1995 vintage. 100 channel table top
unit. Can lock out 10 channels during search. Good
performer except for images. See "The Uniden Bearcat
BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May
1995.

The BC860XLT sells for about $179 at the Best Buy discount
stores around here, and perhaps less via mail order.

I tested both a PRO-2040 and BC860XLT and the PRO-2040 had more
spurious responses, but you can lock out more channels from
a Search. Both models will serve very well as first scanners for
newcomers or as backup radios for "old timers."

Reprints of articles from Monitoring Times are available
for $2.00 each from:

Grove Enterprises, 300 S. Highway 64 West, Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

Note: I don't get any part of the $2.00.

I am getting good reception around the 5000-10000 frequency range. Above that i get ocassional reception at 11000-14000. But I NEVER GET ANYTHING above that range. I am using an eaves antenna. Is this normal or do i need to try different antennas to get reception at these other frequencies. thanks in advance for any replies.

Test purposes is fine, but you can also use it for intercepting real Cellular
Telephone calls as I do.

>michael@alexander.terranet.com
I too bought my PRO 2006 from Durham Radio, I had a wonderful purchasing
experience, (if only buying my photography gear from New York was this
easy). I had my scanner shipped UPS 2'nd Day and indeed had it in two days
The Customs duty was $14.40, which UPS sends the bill for about a week
later. I guess I could ignore it, they already paid it to the Gov't but
that would have violated my personal value system.
All told I still didn't pay $450 for it $410 is more like it. This is less
than the regular price IF I could have bought it here including state
sales tax.
I'm happy, make your own judgement.

>more capable ICOM 7100 is $1000.

You have been collecting data for a year and only have 3 R-7000 transactions on
database? This is what you call reality? Three transactions?? That is a
massive database. What fomula did you use? If I buy a used R7000
for $1200 will you change your figures? After all that would be 25% of your
total database.

>Answer to your question is, your unit is worth $800 to
>$900, probably closer to $800 because the low end selling price of the
>more capable ICOM 7100 is $1000.

This is not pure opinion? More capable? Is that features? Performance? How do
you arrive at that statement?
Are you also aware that a number of people that bought R7100 soon sold them
and returned to the R7000? I know this is true of at least 3 people so there
certainly are more than my small circle of contacts. I myself turned down the
R7100 for a variety of reasons. You will find many may disagree with your
statement about the 7100 being a more capable receiver. I would pay $1000 for
a R7000 long before I would a R7100. Have you owned either of these receivers?

Reality?? There are too many varibles to come to a conclusion with just 3 examples. That is just your opinion, not a fact.

3975. RE: antenna length @ 161MHz ?

Newsgroup: rec.radio.scanner
Date: 1996-02-19 00:00:00 UTC
From: MITCH_CURLY@msn.com
Message-ID: <00001ff6+000047ce@msn.com>
Source record: 239774

Im quite sure that the formula for calculating the length of a
quarter length antenna is 234/f where f is the frequency in megahertz.

By my calculator 234/161 is 1.453ft this is approx 17.5 inches in
length. It is quite possible that the length might have to be
modified
a small amount to include the mounting hardware above the connection of
the coaxial cable.

Hope this helps. Mabey you could borrow a antenna analyzer from some
friendly ham operator.

Revision 1.1 (06 October 1995)

Users: Frequency range: Search step: Mode:

Police VHF 75.200 - 76.400 12.5 Khz NFM
Police UHF 485.200 - 488.200 25 Khz NFM
Fire Service 106.7625 - 106.9625 25 Khz AM
Ambulance 141.300 - 141.600 12.5 Khz NFM
ES Band 138.000 - 144.000 12.5 Khz NFM
A Band R/T 81.000 - 84.100 12.5 Khz NFM
B Band R/T 104.9875 - 107.9875 12.5 Khz AM
C Band R/T 455.300 - 458.350 25 Khz NFM
D Band R/T 461.800 - 464.550 25 Khz NFM
E Band R/T 151.000 - 153.400 25 Khz AM/NFM
F Band R/T 478.000 - 482.000 25 Khz NFM
F Band R/T 484.000 - 487.975 25 Khz NFM
Aircraft 118.000 - 136.000 100 Khz AM
Marine VHF 156.000 - 162.025 25 Khz NFM
Amateurs 2m 144.000 - 148.000 25 Khz ALL
Amateurs 70cm 430.000 - 440.000 25 Khz ALL
Trunking 414.000 - 418.000 12.5 Khz NFM
Trunking TS Band 851.000 - 864.000 12.5 Khz NFM
C.B. HF 26.330 - 26.770 10, 25 Khz AM SSB
C.B. UHF 477.000 - 478.000 10, 25 Khz NFM
Cellular output 870.000 - 890.000 30 Khz NFM
Cellular input 825.000 - 845.000 30 Khz NFM

Notes: o Police VHF is used by mobile patrols
o Police UHF is primarily hand-helds, and linked to VHF repeaters
o ES Band is exclusive to emergency service simplex/repeaters
o B Band is to become obsolete for FM broadcast radio
o Use 10 Khz steps if 30 Khz steps are not available for cellular
o Fire also use: 455.0625, 457.3000, 455.1375, 457.4000,

459.6375

From: MITCH_CURLY@msn.com
Message-ID: <00001ff6+000047cf@msn.com>
Source record: 239777

It always seems to amaze me at how tax dollars are spent. These police depts and fire depts are really being taken for a ride when it comes to these new radio schemes. I think that most of these so called miracle 800mhz systems are junk. I would really hope that the comunity gets involved in trying to stop this foolish waste of money. If these major manufactures want to built these systems they should learn a little more from the cellular industry. Six to ten repeaters for an entire county will not give them (users) the same decent coverage that they already have.

this is just my opinion. Mitch

I'm in the market for a base model scanner in the $500 range.
Obviously, I'd like all the bells and whistles I can get.

Opinions?

I'd really like to do some computer interface, but, from the
postings I've seen, I suspect that this will have to be a trade
off for a good model in this price range??

Thanks in advance for your response.

I don't know if Danmark is still selling refurb-ed BC200XLTs but that's a
good choice for under $200 ($179, the last time I checked).

The fact is Glenn you have absolutely *nothing* to go on other than what you think you know. I have at least made some attempt to put realistic numbers on these sales. While I admit that three is not a lot, it is three more data points than you have. It's also a fact that you sit back on your butt and mouth off about what others do not lnow, when you're incapable of providing a single bit of useful information. Rather than question, which is all you can do, my views, why don't you offer some *meaningful* information or factual data to prove me wrong?

Here's a useful comparison: a pre-EPCA 7000 and 7100. There are *major* differences between the two models, despite your suggestion to the contrary, which warrants the substantially higher price for the 7100:

7100 7000
SSB (USB/LSB) SSB
AM (normal/wide) AM (normal)
FM (normal/narrow) FM (normal)
900 channels 99 channels
25-1000, 1240-1300 25-10000,1240-1300 (does not cover 1000-1025)
Program memory None

The 7100 also has many other programming, memory and convenience features that the 7000 does not have.

Now, let's talk about pricing big shot: I have been keeping a comprehensive listing of asking and selling prices for scanners for the past year. Not only do I record the prices that are being asked, I regularly send email to people asking what they really settled for, so I can compare asking and "real" price. In addition, people regularly contact me with information they have gathered, including their own personal price lists as well as prices they have paid for scanners in recent months. This is pretty solid data--data, I might add, that you are unable to provide to support your observation. am recounting to you the results of what goes on in the used scanner sell/buy marketplace. This info is not my opinion;

this is as close to reality as you or anyone else is going to get.

FYI: 7100 sell for about an average of $1150, although that is based on a small sampling (three units).

But don't take my word for it: Contact batwing411@aol.com. On 2-10-96, he posted a message in which he asked $1050 for his Icom7100. I haven't included this data in my price guide because I have not asked him for the final selling price.

Like I said, Morriseaus's -- and now yours-- observations have no basis in reality.

And what about you Hansen? You're not an idiot? Your postings are nothing more than one little cry baby statement after another. I've seen more wit and intelligence on that playground where you regularly hang out. What in the friggin' hell do you know? What freqs have you posted here? Where's that FAQ you've been working on? Oh, can you please post the directions on making an antenna for cordless phone freqs? I don't know anything about PL tones, can you explain that to me? A friend wants to sell me a PRO43, how much is it worth? What is the unlock code of an OS535.

Come back when you have something to offer you moron. Up to now, all you've done is whine about PJB. Put up or get out of Dodge.

Hmmm, you know I wonder how a device can be illegal if it meets FCC Regs?
It could be that most people (ie Cops) just assume they are illegal. I
haven't seen anything that would make a jammer illegal if it complied
with FCC power levels.

Do you happen to know the voltage of the battery pack if it's connected to
the loader. Mine's about 9 Volts, which seems a bit on the high side.

> Other than comparing regulated and unregulated voltage path values
> with those given in the service manual, you may want to temporarily

Oh boy. I don't have the service manual. I'll try to find one.

I had a similar experience. There is a switch in the connector on the back.
When the power-plug is in, a resistor is put in-line with the batteries.
Wear and tear on my connector caused the switch to 'stay on' permanently.
This caused an extra voltage drop over the resistor, so much so that the
scanner's low-battery indicator came on. I replaced the connector, and my
problems were gone. Until my new problems, that is... :-(

Howdy,

LERN is an acronym which stands for Law Enforcement Radio Network. The Washington statewide LEARN frequency was 155.370 the last that I was aware. LERN has nothing directly to do with the Secret Service operations.

Many states have a statewide network set up although the acronym chosen may be different from state to state. All this is is a frequency that is reserved for interagency traffic, usually involving a situation of importance.

Cheers :o) cws

Nope!! The Data Skip only works on Birdies and Freqs. with carrier but no audio. A strong Paging signal or Cell or trunked system control channel still makes the annoying sound!! BUT, you can lock out up to 50 Freqs. during a search!! So, really the "Data skip" is not needed in this situation!! :-)

Here is a quick and easy way to check if your tv antenna
will be any good as a scanner antenna. Program in all the
national weather frequencies if your scanner dosen't
already have them on a button for you.

Use the antenna you have now (not the TV ant.). Turn your
squelch to full (no noise). Scan the weather freqs. If
only 2 come in then remember which ones. Connect your TV
antenna and do the same thing. If you have a directional
antenna with a rotor then move the antenna and check NSEW.
Count how many come in. Hint, The number of stations you
can recieve should increase.

While at my computer I can't use any antenna except the TV
antenna on the roof which is still horizontally polarized
and directional but I still get much better reception than
with the mag mount on the truck and rubber ant.

What I have suggested is a check only for one particular
band but you should get the idea, and use it on some of

the other distant stations you are trying to receive.

Have been using it for a week. Software is extremely good and a joy to use. Receiver is OK but not
up to standard of top scanners or HF radios. Of course it does not cost as much as one of those,
either.
As amatter of interest , the tech who installed it for me was very impressed by standard of the
card.
In all....I am happy with it.

You better not lot the credit card company find out you are adding a surcharge for card users. This will immediately disqualify your source from being able to take major credit cards (if you are in the U.S.).

No Code = No Brain = C.B.

The following message is a refutation of the above statement.
In fact, the following is much more true:

Amatuer = Ham = No Brain

My last post on this thread caused me to receive no less than 5
emails from upset amatuer radio operators attempting to defend
the current F.C.C. license tests which include Morse Code testing.
Let me take a moment to say that it has been my experience that
amatuer radio operators are usually fine citizens and they are very
helpful to persons seeking to follow the prescribed path to obtain
a license to transmit within the bands designated for amatuer radio
operation. I commend the amatuer operators for being so darned
helpful. The flipside of the situation is that the number of people
becoming interested in the old hobby is at an all time low. In my
opinion, most types of people today who might become interested
in radio are very quickly choosing computers instead, and for many
reasons. The rate of technical progress for radio is at a snails pace
compared to computers. Computers require no license at all. I think
that one of the problems here is that most of the old ham radio
people (the ones who are still interested) fall into one of 2 classes:

1. They are proud that they learned the 1800's trade of Morse Code
2. They think the government is god and it would be unwise to challenge

At this point in time it might be best if the F.C.C. started thinking about
alternative uses for the many bands that are assigned for amatuer usage.
These bands are currently under utilized and would be
more useful if they were assigned to another purpose.

As an alternative, the government should then assign some bands for
general civilian use and then require every radio to have a sub carrier
digital encoder that identifies the radio so that any person causing
problems could be identified and fined. Needless to say, some people
would just remove the encoder, so maybe it's not really possible to
regulate radio use.....

Just some thoughts and ramblings.....

4019. FDNY Box Program for Windows

Newsgroup: rec.radio.scanner
Date: 1996-02-20 00:00:00 UTC
From: JRM <e54t4bc9@gate.net>
Message-ID: <4gbk4l$252q@news.gate.net>
Source record: 239609
Cross-posted to: alt.radio.scanner,rec.radio.scanner

For any FDNY radio listeners out there, I highly recommend for enjoyment the purchase of the FDNY Box Program.

The Windows Program allows you to select a boro and enter in the box number which will provide you with the cross streets and any additonal info.

** Example **

Queens Box: 0269

Crash Box
JFK International Airport
** Automatic 2nd Alarm **

The program will also allow you to enter to search strings in searching for boxes which can be searched either by one boro at a time or all boros.

The program runs $20.00 and has a 10-Code list built in. I am not the one selling it, but just an avid listener recommending it.

Send a check made payable to Lewis Kopp to:

FDNY BOX PROGRAM
PO BOX 650434
Fresh Meadows, NY 11365

He has a swareware version available for downloading on AOL. I downloaded and used it and have ordered the actual version.

If you have any other questions regarding it, I would be happy to answer them.

Lewis Kopp can be reached by E-mail at lkopp@pipeline.com or LKopp@aol.com.

"10-75"

: > - Optional SW package to allow full range of data manipulation and up/down load

: 1. Someone else mentioned CTCSS programming
: 2. How about at least 1.2AH battery packs. None of these 500mAH stuff.
: 3. Better audio, better audio amp and larger speakers.
: 4. Since it is heavily compterized already, how about extensionl speaker
: (Speaker Mic style) with alpha-numeric LCD display, like the one ICOM got now.
: 5. Better case/enclosure like commercial two way radio, none of these
: el-cheapo polyethlene bearcat cases.
: 6. How about better and more flexable rubber duck, perhaps with switchable
: pre-amp built inside. BC200XLT's original rubber duck is so stiff, it keeps breaking the
solder
: connection inside.
: 7. How about accessories like, mobile mount plug-in cradle that has antenna connection,
: power, and external speaker. I think one of the Maxon CB portable got that. This way you
get in
: your car, plug the portable scanner in the cradle, and you got instant mobile scanner.
: 8. Hey! how about Optoelectronics's Scout reaction tune features built onto the
: handheld scanner.

: Just a few wishful thinking of mine.

WHAT, no DCS decode?
DTMF decode would be nice, and since this is a fantasy, how about a
trunking decoder(to FOLLOW those juicy PD calls, without hearing the
dogcatcher, etc).
BTW 20 banks of 10 channels are better than 10 banks of 20 channels.

: If so when is something better expected to come out?
: Did anyone ever find the source code to open up cell in the ar8000? if
: so, is it avaibable ftp?

There is a freeware program available..just ask around here, you'll find it.
Several commercial programs can do it also(ScanStar for one).
Also several companies will unblock 8000's(Grove & Cellular Security
Group, among others).

: Why has the Icom RC-1 been so popular for such a long period of time?

The Icom R-1(NOT RC-1)! is NOT very popular with most people.
The performance is so-so at best, unless you are MILES away from a major
city.
The unit's main "claim to fame", is it's size...very small, and easily
concealable.
It also has continuous frequency coverage, except for some receient
units(there is an unblock available for these).

: Just a few questions I had to get off my mind. Any help would be
: appreciated. Thanks. Russ

: You can't possible get a scanner that you can program all the possible
: cellular frequencies in, anyway, and the damn thing would never be able to
: scan them!

I thought that there were 666 cellular frequencies. Radios like the
PRO-2035, PRO-2042 have 1000 frequencies which they can scan. However,
someone would have to be very devoted to manually punch all of those in,
because scanners generally do not support 30Khz spacing.

I agree with you. Why does anyone want to listen to cellular? The only
reason I can think of is that it's interesting solely because it's
forbidden. There's the "thrill of the hunt" about figuring out and
making "mods". Sort of the same thing that motivates a hacker to break
into a computer when he can buy an account on it for $20.

The new ones generally have a model number of 20-148A as opposed to
20-148. Also some of the new ones I have seen have a detachable DC power
cord so you can use it in the house with an AC adapter. The memoryis also
good for about 14 days without power. The old models only about 3 hours.
So If there is a sticker that says: "New Base version" on it it's a new one.

Does anybody have a copy of the Grove FCC database on CDROM ? I would like to get a printout of some frequencies. I don't know if the software can do this but I would like to get all of the frequencies within a 1 mile radius of a LAT/LON. If this can be done and you could email me the results I would really appreciate it. We are trying to locate the source of some interference to our Amateur radio repeater. The repeater is on Santiago Peak here is CA and the LAT/LON is:
LAT: 33-42-41
LON: 117-33-08

Thanks, Bruce Forsberg WB6IZG

If you're using your scanner to avoid traffic tie-ups, try to find the freqs that the local traffic-reporting service uses. In any large metro, there's only one or two traffic-reporting services for ALL the radio stations.....you'll get some really juicy tidbits from conversations between the base and the plane(s.)

ARRL also offers insurance for ham radio equipment and also covers computers and other items as they relate to ham radio operation.

While covered by another insurance company years ago, I had a scanner stolen at a hospital I was working at. They covered it!

Interesting answers!!! Actually RG= Royal Grade.
Originally there were several grades of cable with the Royal Grade being
the best.

Having worked for a few months at Radio Shack after college, I have
mixed emotions about the thread here. True, many salespeople (management
calls them "Salesmakers"...heh) don't know much about the technical
^^^^^^
brass tacks of, say, building a power supply. However, what you must
understand is that Radio Shack is like most other American retail
corporations: Marketing ("you've got questions....) does not always
communicate with Sales ("what's the question again?) or, much less,
people on the sales floor ("Uh, let me get the manager.")

Next time you're in RS, grab one of the neat little reply cards
Marketing has printed up for all the stores. Pissed about being asked for
your name for the 13th time in a month? Put it on there! Tired of
explaining the difference between slow-blow and fast-blow fuses to the
salespeople? Write it down! Depressed when you realize that your reason
for bitching is that the only people left in the food chain below you are
radio shack clerks? Well....better see your therapist on that one.

Excuse me, please, but I thought *radio communication and experimentation*,
if anything, is the "essence" of amateur radio. Selecting one mode and
exalting over it all others is nonsense. I suspect the prophecy ("CW
... always will be the essence of amateur radio") will be disproven
inside my lifetime, if not before my infant graduates from high
school.

Note the followup-to: line, please.

My insurance company (AAA) told me that as long as it is something that is designed to be used not only in the car but also in the home, or anywhere else you may be, it falls under HOMEOWNER'S insurance!

Contrary, if it is INSTALLED in the car, either in dash, or under dash, it is considered an "AUTOMOTIVE ACCESSORY" and you will have to deal with the car insurance people.

My insurance covered the theft FROM MY VEHICLE of my 2m HT and handheld scanner, which were just placed in between the two front seats where the emergency brake lever is, and connected to the coax. Not installed, per se, but just lying there. Since they were not "installed", the insurance covered them! Also, my wife's cell phone was also stolen, and was covered, too. It was stored under my front driver's seat, NOT INSTALLED, and therefore covered!

Don't need any mods on it. It already covers everything. You don't REALLY want to listen to cell phone calls, do you? So, what other kind of mod are you talking about? OK, maybe to go to more than 200 memory channels, but that's it.

I know that you can get modified audio tape recorders
(speed slowed down a certain percentage) from
places that deal in bugging equipment-("Spy Shop's").
These units can record up to 3-4 hours (with some loss of
sound quality). They are used for phone bugging recordings.

Try http://www.tscm.com for info.

Alternatively we made our own unit by taking a standard
piano type portable recorder, opening up the little plate
that covers the motor and modified the feedback resistor
value on the electronic speed-control circuit. This resistor
normally is in series with the speed adjustment pot (assuming
a standard motor with electronic speed control). We also
found that adding a 1n400x series diode between the regulator
and motor terminal (in-line with say the +ve terminal) reduces
the speed without loss of start-up torque.(You can also try
and fit more than one diode in series without modification to
the regulator circuit. In our application we needed adjustable
speed from standstill to full speed)

Why on earth would anyone want to listen to cell phone calls? Do you know how cellular works? The only way you'd be able to listen to one complete call would be if the person calling remains in one spot during for the duration of the call. If he moves around, you're gonna lose it.

Each "cell site" has, say, 100 "channels". How many cell sites are there? Plenty. Do the math. It's not worth it. Why listen to someone else's phone calls, anyway? You'll hear more interesting stuff on baby monitors.

The Uniden BC3000XLT is a FAR SUPERIOR receive and has higher audio output than ANY of the Radio Shack models. Plus, 400 channels is better than 200. The RS scanners are OK, but why have OK when you can have GREAT? Also, look at AOR.

WHY is everyone so interested in CELLULAR?

Definitely go with the BC3000XLT. It's easy to use, has a GREAT receiver and GREAT audio output. 400 channels is MORE than enough.

I had an AOR1000XLT which also dipped into the shortwave spectrum. You won't hear a DAMNED THING with the rubber duck. You'll have to connect it to an external antenna. It DOES work, but you'll be disappointed if all you use is the ducky.

4048. WHY CELLULAR?

What is the big deal about listening to cellular? You won't be able to hear complete calls and it's totally by chance what you'll hear anyway! You can't possible get a scanner that you can program all the possible cellular frequencies in, anyway, and the damn thing would never be able to scan them!

The Sears scanner you are refering to IS an SBE Optiscan!
Sears just had their name put on it.
Any data on the Optiscan will work on it as well.
(and yes, I realize that I should have replied to the original poster
instead of the previous reply, but what the hell, he'll see it anyway)!

I'm sure some of the London "residents" on alt.radio.scanner.uk would be
able to help you with some specific frequencies of interest.

Main areas to look ar 451-453MHz NFM 25KHz and 147-153MHz, AM & NFM
12.5KHz.

Does anyone have any info about scanning in Japan, specifically Tokyo? (Fire, Police, Cellular phones, etc.)

I have a Icom R1 and some published frequencies but I don't seem to hear much traffic.

4057. AR3000 bass restoration

Newsgroup: rec.radio.scanner
Date: 1996-02-20 00:00:00 UTC
From: Enrico Segre <segre@polito.it>
Message-ID: <31299F01.3895@polito.it>
Source record: 239647

(I try reposting since apparently it didn't get through)

I have recently done my first hack on the AR3000. I chopped off an SMD R and C, patched a shunt and an additional C on the main board. This way I removed the ~300 Hz HPF which filters the audio in AM/NFM/SSB modes, and I find the increase in audio quality is really worth (I can enjoy broadcast SW for instance). I can provide the details, and I'd like to get in touch with someone with similar experiences; please email me.

Partially prompted by this success and partially by the 8k discussion, I'm also considering to add a switchable narrow IF filter. The patch seems again easy, but rather than using the SSB filter I'd add an extra one, with a bandwith of ~7-8kHz to kill the 5kHz whistle on SW, but to leave sufficient bandwidth. I hope that to improve slightly also the blocking problem of the AR3000. Any comments?

This is the easiest way to decode simple frequency inversion. I had a cheap AM wireless mic once that
I used to rebroadcast the scanner audio to a short wave Rxcvr (sony 2001). By tuning in the AM mic on
ssb and adjusting the bfo, you would get the decoded audio (plus the annoying tone of the carrier). Bit
cumbersome but it worked. Probem here is that everyone is now going to rolling code inversion or worse,
digital voice privacy

The frequency in question possibly might be a "birdie", a frequency which the scanner in not capable of receiving. Most if not all scanners have a number of so-called "birdies". You might check the documentation. It's not out of the question that one of the IF's is at this frequency, and the the scanner is programmed not to tune it.

Dear AR3OOO users, or related,

Please read the request below, which I posted before.
I recieved a lot of interesting reply's, but not
yet the whole answer :

I know that it should be possible to make the IF
of a AR3000 (normally 12 Kc for NFM and AM) more
narrow (2.3 Kc).
I also know that this gives improvements in especially
Shortwave and Airband reception.
I also know that firms like Bogerfunk (Switzerland) are
advertising with this (Deutch-Mark 150,-).

Only I like to do it myself, and preferably for free !

Therefore, maybe somebody knows the following :

* Is it possible to modify the IF of the AR3000 just by
a switch between the current SSB filter (2.3 Kc)
and the normal IF filter (12 Kc) ?
Or do I need to buy new extra filters ?

* Could somebody mail (marcgauw@simplex.nl) or fax me
a swithing diagram how to do it myself ?

I would very much appreciate a reply !

Marc Gauw, Holland

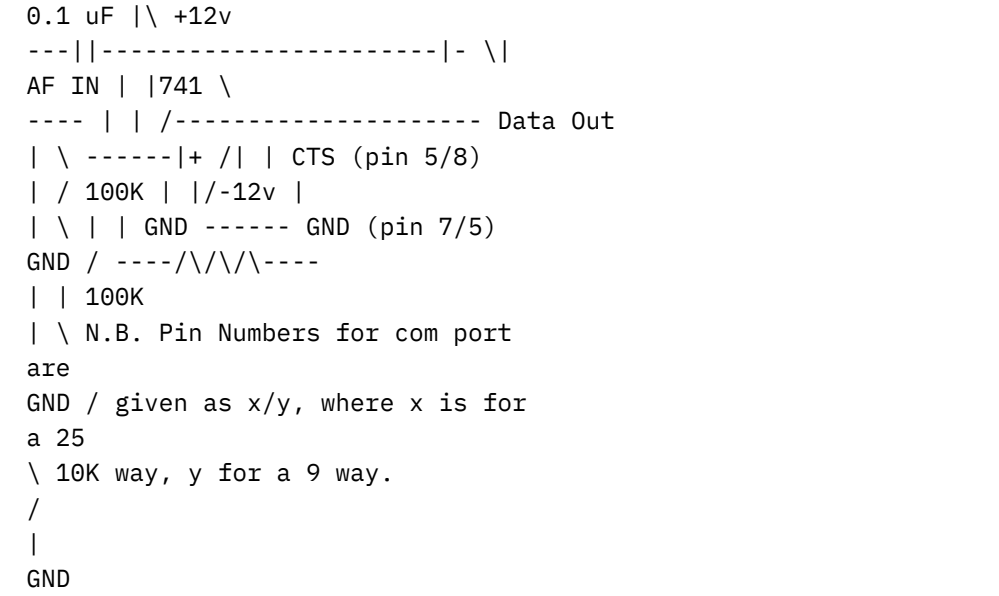
4074. PD200 POCSAG decoder

Newsgroup: rec.radio.scanner
Date: 1996-02-20 00:00:00 UTC
From: zdanowsk@cybernex.net
Message-ID: <Dn38K1.AEz@news2.new-york.net>
Source record: 239664

Does anyone know what this means, I am trying to build the cable for
this pd200? Has anyone built this? I plan to hook it up to a BC 760.

****
The PD program requires serial POCSAG data to be applied to the CTS
pin of
one of the PC's COM ports. RS232 levels are required, ie at least
+/- 3v.
PD is insensitive to polarity, ie it doesn't matter which way up mark
and
space are.

As POCSAG is transmitted as direct FSK of the VHF/UHF carrier the
ideal way
is to take the data direct from the discriminator, via a data slicer.
The
following circuit, however, has been fairly successful, taking
audio
directly from the receiver's speaker output:-



The above circuit is a Schmitt Trigger, having thresholds of about
+/- 1v.
If such a large threshold is not required, eg for a discriminator
output,
then the level of positive feedback may be reduced by either
reducing the
value of the 10K resistor or by increasing the value of the 100K

feedback
resistor.
****
****

Thanks Bill

Take your 1/4 wave and multiply by two for 1/2 wave. Multiply again by two
for full wave. Or (246*4)=984/frequency. Funny how simple things can be eh?

Recently I asked on Rec.Radio.Swap for someone who sold Motorola parts. I have seen all the recent posts on Rec.Radio.Scanner and Alt.Radio.Scanner about disaster tales of buying parts or radios from people on the internet.

This was my first time buying something from someone on the internet and thought I would pass along my appreciation.

I ordered a Saber earpiece adaptor from Carl Robbins of Carolina Radio. He kept the price he promised, and said I would have it in 3 days from the time he recieved my check. He delivered my adaptor to me right on time, brand new.

His e-mail address is Crobbins@sunbelt.net. If you have ever want to buy a part or radio from him that you see him advertising, I highly recommend him and his company.

Too bad there aren't more responsible people like him.

Thanks Carl for the earpiece adaptor, it works GREAT...!!!!!!!

> calls, anyway? You'll hear more interesting stuff on baby monitors.

You'd be surprised at the number of full conversations you'll pick on a
cell phone. The most interesting thing I've heard on a baby monitor is a
Mother swearing at the baby. In an average apartment building you might
find maybe 2 baby monitors with the same baby crying all the time, and the
same parents singing the same songs all the time.

With cordless phones you will most likely end up with 8 or 9 regular
people on the phone around you, although conversation can be quite
interesting, you always hear the same people over and over. Now with
Cellular you always have someone different. During the day you can always
pick up some good financial information. At night, it's better than TV.
It's REAL entertainment. There are lots of 900 calls made, fights, etc.

So if your're VERY lucky you might find some action on baby monitors.
But you'll always get some stuff on cellular.

I usually listen to cellular after midnight, so there aren't a ton of
people on. If I happen to lose a conversation I just scan through the 833
possible frequencies and usually find it again within a few seconds. I
like to get the phone number, then go to a pay phone and tell the person
what I just heard. The reactions you get can be quite amusing. By the way
when listening to cellular you don't program the frequencies in your
memory, you SEARCH between the frequency limits.

I am a Ham operator Advanced class. KI5GY, first licensed in 1973.
I have in my car a 2 meter, a Ten-Tec Scout on 80, 40, 20 and 17, and
Cobra CB.

I drive several hundred miles a week, and listen to all 3 radios.

In the late 80's the CB was unbearable, the 2 meter OK, and then 10
meter was good (I didn't have 80 mobile then). Now, 80 meters is as
bad or worse than 11 meters is or ever was, and these are hams who must
have morse code at 13 wpm or better. They are licensed, but sickening
to listen to, hate and racism, foul language, too much power, all the
things I heard were wrong in 11m.

2 meter has gotten fairly clickish, but I have a group in most cities
I talk to. But now quite a bit of my time is listening to the CB and
occasionally talking some. I find it more pleasant than 80m or 20m.
40m is still OK, and 17 is wonderful when it's active.

I learned more about mobile installations and coax connectors from a CB
enthusiast than I have ever from a HAM. I know a local Extra Class ham
who has a friend come over to make a jumper coax for an SWR meter.
Nether group has a lock on knowledge or technology. I for one like
mobile, and restoring old gear, so I have all new gear in the car,
except for the CB vintage 1980, and old Collins and Drake gear in the
house. I get along with both groups, the homebrewers and the appliance
operators. I know guys who can get Worked all States awards, I don't
have a clue how to do that, and I respect him for his accomplisments, I
have another friend who can fix anything, and has designed and built
most of his equipment, I respect him for that, but generally he has no
respect for appliance operators and they could care less about
designing a spectrum analyzer. I really don't see why there should be
a rift between the two groups, or the Ham and CB group. I enjoy both,
as well as the usegroups of both. I don't usually respond to these
type of threads, but I have become sick of the mess on 80/75 meters and
really feel it is no better than anything on 11 meters now. Any of you
hams, listen to 75, then listen to 11, read the letters in the March 96
QST, complaining aboput 75m, read all the trash in the usegroups, and
make your own decisions.

There are a good and bad in both groups. Most of the people in both
groups are into the hobby for one reason, they like to talk to other
people.

My favorite story was several Hams on 2 meter discussing how silly
CB'ers were to think a tennis ball on their whip would help them get

out better. I asked them how they kept their whips from striking the sides of their vehicles when they went over bumps, there was dead silence and finally one of them stated they guessed maybe that was the reason for the tennis ball. They were so dense they couldn't even figure out why the tennis ball was on the whip, it took a CB'er or probably a farmer to figure out a clean cheap way to solve the problem.

Anyway I don't see cb'ers bashing each other in this conference like I see the hams at each other's throats in the ham conferences. I guess some of the hams can't see a conference without some wasted bandwidth so they have to come over here to make trouble.

>press them for the precise price to avoid getting ripped off like I did.

The PRO-2006 price is constant at CANADIAN $529.00. If you pay by credit card,
your card will be charged $529.00 (CAN) and the credit card company will charge
whatever the prevailing exchange rate (plus a small premium, usually) on
the day the purchase posts. Thus, depending on the international money
markets, the US price may vary by $25.00 (US) or so, from day to day.
Durham has NO control over this. If you want to purchase at a precise
price, you will need to go to your bank and purchase $529.00 in Canadian
funds and send that to Durham...

My PRO-2006 cost $390.xx (US) with FREE postal service shipping (registered
and insured). Duty is hit-or-miss (entirely up to US Customs). Durham
told me approximately what the duty could be (I don't remember the
exact amount) but I was lucky and no duty was charged. If a duty is levied,
you will have to pay the delivery person/post office before you can get your
package. Side effect of importing. If you can find one in the US,
go for it :) .

I have a 1 year warranty, and they did the cellular mod and the scan
speed-up mod (both diode clips). Used, as-is PRO-2006s sell for $250.00
and up in Dallas (I know a guy who buys/cleans-up/resells that regularly
moves them for $300+).

4090. Mobile Scanner Usage

Newsgroup: rec.radio.scanner
Date: 1996-02-20 00:00:00 UTC
From: cwstan@holli.com
Message-ID: <Dn2w9p.9wE@iquest.net>
Source record: 239680

Howdy,

Since there have been some posts wherein the question has been raised concerning some of the practical consideratаons regarding the use of mobile scanners [MS] I thought perhaps the starting of a new thread was justified.

While by no means an "expert" regarding this subject I have never-the-less utilized a MS in all 48 states and several Canadian provences. Thus perhaps some of my observations may provide some useful ideas to those less experienced. Also, perhaps this thread will prompt some of the more knowledgeable users to provide input.

Some have ask if the MS is useful in the area of avoiding traffic citations. My experience would indicate that the short answer is "not very". If someone's primary reason to buy and use a MS is to avoid traffic citations I suspect that they will be greatly disappointed. Naturally, there are times when speed enforcement activity will be detected by the use of a MS. One example of such an exception would be when the police are using an airplane to spot speeders on a particular stretch of highway. The radio traffic _from_ the airplane can usually be intercepted several miles away. With a little experience the listner can usually recognize the air to ground traffic quickly. Usually a tip off as to the proximity of the activity is to listen for the ground to air traffic. If the ground to air traffic can be heard the activity is likely _close_.

While the usefullness of the MS in avoiding traffic citations is problematical, there are _many_ uses for a MS. I'll list some of the MS uses that I have found to be really practical. I'm sure that there will be experienced MS users that can add to this list. The MS is a _great_ tool to aid one in obtaining the earliest and the most accurate information regarding traffic and weather conditions.

By monitoring the public service bands one will hear reports concerning all sorts of road and traffic hazards: [drunk drivers, a high speed chase, articles laying in the roadway, emergency vehicles making a run, disabled vehicles, accidents, traffic congestion, wrong way traffic, road closed due to various reasons, broken pavement, fuel spills, etc., etc., etc.. The list is almost endless. Just use your imagination. I have intercepted traffic on my MS regarding almost every imaginable situation that could constitute a traffic hazard. Often the MS provided me with the _first_ and the _most accurate_ information available. But then there is also the National Weather Service broadcasts!

The National Weather Service broadcast weather information 24 hours a day, seven days a week, and 52 weeks a year. In times of inclinment weather these broadcasts can be _quite_ useful to the highway traveler. There have been

times that the information that I got by listening to the NWS saved me a lot of time. Time that would have been spent sitting in a truckstop while the road was closed due to snowstorms. I was a few miles one way or the other and trucking on because I had the information ahead of time. Then there is the tornado season and the serere weather watches.

When the NWS issues a serere weather watch the _sky warn_ net goes into action in many parts of the US. The Sky Warn Net is a network of local Ham operators that work in co-operation with the NWS in spotting tornadoes and severe thunderstorms. By monitoring the frequencies of the local Ham club's repeater[s] output the sky warn traffic can be monitored. This makes for interesting listening and at times can provide extremely useful information. I once listened to the local skywarn net track a tornado that was within two miles of my location! You can bet that my ear was _glued_ to the speaker in my little BC 200 XLT!

Then there is the local TV and radio helecopter and/or airplane that is used for traffic reports. _Very_ informative! This radio traffic can be monitored easily and will provide accurate, on the scene, and timely information regarding rush hour traffic. The helicopter/plane to studio traffic will normally be five to fifteen minutes prior to the AM or FM broadcast of that information to the general public. There have been numerous instances over the years when the information that I received by monitoring this traffic has saved me a lot of time sitting in a traffic jam.

When time and inclination permit there is monitoring that can be just plain entertainment. I've had fellow scanner buffs relate to me some of the "entertaining" traffic that they had monitored. They tell me that they have listened in to cordless telephome conversations that were extremely interesting. Ditto cellular calls. Since the monitoring of these frequencies is illegal I would never personally engage in that sort of thing, but it is my understanding that there are unscrupulous individuals on the loose that do engage in that sort of activity. I hear that it can at times be very interesting! I have been tempted!

Cheers ;o) cws

> Thanks!

Here are the codes for the Sears Model 934.36390601:

33.780 = * 2 3 * 5 6 7 8 9 * 11 12 * * 15 16

155.205 = 1 * * 4 5 * 7 8 * * 11 12 * 14 15 16

155.280 = * 2 * 4 * * 7 8 * * 11 12 * 14 15 16

460.275 = 1 2 * * * 6 7 8 * * * 12 * 14 15 *

Where * means punch a hole in the card.

Hello, i am new to this scanner hobby, I have an older (6 years old)
radioshack 20 channel scanner. The only thing i use it for now is
once in a blue moon i listen cordless phones. The antenna i use is the one
that came with the
scanner, but i have some sort of converter that i can use. Can someone
help me out on making a better antenna for my scanner?

I know you can buy them, but are they easy to make yourself? Please help
me out and tell me where to find some info on making it.

Thanks,

kakuk@server.uwindsor.ca

On the other side of the coin there is:

60 ft tower + 1500 Watts + $1200 radio = NO BRAINS

I am a technician and like building my own kit/antennas. I will be much more satisfied with a Worked All States from my own equipment then if I dropped $10,000 for a setup. I was talking with someone just like this on the air. The first thing that they said was, technician huh!, well you can upgrade!! then they proceeded to state that they could not talk because they were DX'ing Africa. Well how much brains does it take to DX anything with that setup.

The standard reference is "The Compendium of American Railroad Radio Frequencies" (200 pp) by Sturm and Landgraf. It's available from hobby shops (model trains) or Kalmbach Publishing (800 533-6644) for $16.95. It lists virtually all frequencies, ordered by railroad and location.

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Railroads [90.91]

Ch Freq

2 159.810
3 159.930
4 160.050
5 160.185
6 160.200
7 160.215
8 160.230
.. ..
96 161.550
97 161.565

The channel designation is that assigned by the Association of American Railroads. Chs 2 thru 6 are used only in Canada. Above channel 6, spacing is 15 kz.

>Seems like this would be possible if the same bandwidth is being used.
>B.
>

I receive SAP from a local station in Pittsburgh, PA (they
continually broadcast the local weather report) while connected to
cable. The SAP is received with no problem. However, another local
channel that shows SAP present (via the indicator light) has the same
audio on SAP as well as the normal audio setting.

>And what about you Hansen? You're not an idiot? Your postings are nothing
>more than one little cry baby statement after another. I've seen more wit
>and intelligence on that playground where you regularly hang out.

So you are the pervert that has been hanging around that playground. Figures.
OTOH, what you say is what you are doing now. Pot calling the kettle black
there chump?

>What in the friggin' hell do you know?

Now that is intelligent? Where would you like me to start?

>What freqs have you posted here?

Most of the UHF/VHF freqs I scan are useless to anybody but the people in my
area. I certainly can send you copies of the files that I have sent to
people on the net in my area that asked for frequencies.

>Where's that FAQ you've been working on?

Didn't know I was. I can just imagine you answer as to why you came up with
that. Would you like a link to a scanning FAQ on the WWW??

> Oh, can you please post the directions on making an antenna for cordless
phone freqs?

Sure. I would cut a 1/2 wave dipole for 46.7 Mhz. Make it 10ft total length
and you will be in the ball park. Cut 10 foot wire in half. Solder one end to
the center conductor of your coax feedline and the other to the shield.
Weather proof the connection. Hang antenna vertical or in sloper fashion.
If you want to go hardcore we can talk yagi and quads.

> I don't know anything about PL tones, can you explain that to me?

Sure, PL is Motorola's trademark term that stands for Private Line. It is the
method called CTCSS (continuous tone-controlled squelch system) . There are 42
standard tone frequencies with an alphanumeric name given to each. When your
transmitter uses CTCSS it sends a subaudible tone along with whatever else
your transmitter is sending to activate receivers that are using the same tone
to control their squelch. This is also found commonly on ham radio repeaters.

>A friend wants to sell me a PRO43, how much is it worth?

Blocked or unblocked? The going rate is from $250 to $290 on unblocked
Pro-43's. Seems inflated but blocked scanners bring in a higher price
than unblocked scanners. I sold mine for $285.

>What is the unlock code of an OS535.
Who the hell would care other than an OS535 owner?

>Come back when you have something to offer you moron.

What have you offered Michelle? Let's see. You made yourself out as an ass quoting prices on the Icom R-7000. I mean any fool that would come on as an expert on prices because he has a database of 3 transactions certainly shouldn't be pointing fingers at others. You are clueless but have to try and pretend to be an expert. Three transactions in over a year, you really have a large collection of data. HAHAHAHA. Yea, your advise is sound!!

>Up to now, all you've done is whine about PJB. Put up or get out of Dodge.

Who forced you to read it Michelle? Are you the self-appointed moderator now? OK, I answered your silly questions. It was a challenge you made with the implication I couldn't answer them. I did, so kiss my ass and shut your ugly blow-hole punk.

grh

BTW, how much did you get paid for being the Pro-Abortion poster boy? The campaign certainly swayed me when I saw your picture and the words below it " This needless tragedy could have been prevented " .

Hi Folks,
Today (2/20/96) I was able to confirm that Mr. Hall indeed
has defrauded me - I called him twice this AM and he hung
up on me both times. I would love to post this to a Seattle
news group as one responder (Mr. Schertzer) suggested but
my news provider does not give me access to
seattle.forsale.misc.

Thanks also to others that suggested methods to try and
reduce getting taken in business transactions on the
internet.

Jon Scott

How much brains does it take to DX with a four watt CB? I didn't
think any, in fact its more luck than anything. Sure, you might get
into propagation patterns, and predicting good DX times but my
experience shows that CB'ers and most hams don't. They just wait for
the skip to roll in and start jamming up the band with nonsense.

How 'bout it DX land, anyone out in DX land got a copy on IMAGENIUS
in the sunflower state, break, break, break!

Now, that is intelligence. What's worse is that most CB'ers don't
give others a chance to work a station, they just keep repeating over
and over the DX call until someone finally answers back.

I don't understand why there is such a war between Amateur operators
and CB operators. Isn't the hobby the same? Don't we all want that
distant contact? This fighting is ignorant. I talk on both, and have
a great time.

It is no big deal. But it's the 'forbidden fruit' thus people
are drawn to it cuz it's naughty to listen. You also get to say
"Yahoo, my scanner picks up cellular" and impress your friends.

> You won't be able to hear complete calls

Yes you will, but not all the time. And yes, you can hear both
sides of the conversation (depending on the phone's hybrid
circuitry).

> and it's totally by chance what you'll hear anyway!

Well, isn't that generally what scanning is all about?

> : You can't possible get a scanner that you can program all the possible
> : cellular frequencies in, anyway

Yes you can. An AR8000 and some of the high-end RS units would hold them all, if you
were crazy enough to want to program all of the frequencies into the radio.

> and the damn thing would never be able to scan them!

Why not? They are channels like any other radio channels, assuming the
scanner allowed access to cellular frequencies. Many do.

Actually, it is NOT practical to program in all the frequencies.
It makes more sense to SEARCH the cellular ranges, or program
the search range into a search bank (if your scanner has this).
SEARCH means start at one frequency and search forwards or backwards
to an ending frequency. Many scanners can do this, and on cellular too.

> I thought that there were 666 cellular frequencies.

There are about 833 frequency pairs (25MHz / 30kHz spacing).

>Radios like the
> PRO-2035, PRO-2042 have 1000 frequencies which they can scan. However,
> someone would have to be very devoted to manually punch all of those in,
> because scanners generally do not support 30Khz spacing.

Yes, quite devoted (and off their nut). Although scanners like the AR8000 can
easily be set to 30KHz spacing, as can others.

> I agree with you. Why does anyone want to listen to cellular? The only
> reason I can think of is that it's interesting solely because it's

4104. Strange practices of my FBI field office

Newsgroup: rec.radio.scanner
Date: 1996-02-21 00:00:00 UTC
From: db477@cleveland.Freenet.Edu
Message-ID: <4gfk7r$pj3@madeline.INS.CWRU.Edu>
Source record: 239493

Hi,

I have a question I hope someone can answer. Here in my hometown, I
am able to monitor the local FBI field office on several frequencies.
One of the frequencies is more active, by far, than the others. Judging
from the traffic I hear, it sounds like a dispatcher's channel. I
usually hear a woman, speaking like a dispatcher (providing information,
answering questions, checking the "criss cross," relaying messages, etc.)
and a man speaking to her on the other end.

Now here's where it gets weird . . .

I've heard this same frequency identified as F-2, F-3, and F-5. Why?
Could there be various input frequencies using the same repeater output
frequency, with each input using a different CTCSS tone? What would be
the point though?

Also, and this is the craziest, the woman "dispatcher" is ALWAYS in
the clear, but the "field agent," presumably in his car, is always
digitally scrambled. Why?!? Since I can hear half the conversation,
I can almost always deduce what they're talking about. From the
dispatcher I've heard license plates, addresses, agent's cellular
phone numbers, suspect's names, NCIC reports, "28 returns," etc.
Shouldn't this be secret too? Why might this be happening, and
what would be the point in scrambling only half of a conversation?

Any help would be appreciated, thanks

Cliff Pearson

Cross-posted to: rec.radio.swap,alt.radio.scanner,rec.radio.scanner

I have dealt with dozens of people on the Net, sometimes with transactions involving thousands of dollars, and I have yet (knock on wood) to be dealt with unfairly!

I feel that if you do your homework, ask lots of questions, and take your time (don't rush into anything), you can get a very good feeling on the potential outcome of a deal. If you feel funny, DON'T DO IT!

Get all of the information up front, condition, quantity, price, location, shipping, method of payment, included accessorries, contact phone numbers, mailing/shipping address, Call Sign, etc.

If someone balks at providing good contact info (like a phone number), just drop it right there.

I get a feeling that SOME (not all) of the bad Net deals I hear about are people rushing into what they thought was a great deal because they were afraid if they didn't jump, it would be gone.

Any deal that sounds too good to be true usually (but not always) is. A REAL deal may get by you from time to time, but taking the appropriate steps will usually go a long way to insure that a legitimate transaction that is good for all parties involved is the result.

I'm the author of the (now rather old) DOS-PC/ICOM R700/R7100/R9000
scannning program called 801SCAN. It was one of the first such programs.

I have posted the often-requested-but-never-revealed schematic to the
self-contained level-converter interface on our WWW page. This interface
can be built inside a DB-25 shell and requires no external power. It
is particularly nice for those using notebook computers to computer-scan.

The 801 programs are still available, but I don't supply interfaces
any more :-)

The page is at http://www.terzon.com/

4112. dipole grounding??

Newsgroup: rec.radio.scanner
Date: 1996-02-21 00:00:00 UTC
From: onedown@cris.com
Message-ID: <4gfv7h$2h5@spectator.cris.com>
Source record: 239501

I have a uniden 860 xlt which seems to be a decent radio. Question is, Im using a radio shack dipole antenna which I have the shield of the cable connected directly to a ground rod, this greatly increases reception but the reception gets better still when I have my hand on the sheild also. What is the best way to have this antenna connected for optimum reception?

Also after opening the case and seeing all the surface mount components, am I right in assuming there are no mods available for this radio. It looks really easy to ruin, and Im an electonics tech, plus journyman electrician.

Thanks in advance, Onedown

>repeaters, or the CB channels.

It sounds like the interference was on the other end of the call. The transmitters leaked (or a high power amplifier injected) the signal into the other end of the phone line. It is unlikely that the long distance "wire" picked this up, since that traffic is digital.

>Why would anyone want to monitor fast food joint frequencies? Is this
>list compiled for "Lock-Outs" or is someone trying to find out the
>ingredients of the "Special Sauce"?

No, everyone knows that the Sekrit Sauce is Thousand Island with Catsup.

The reason for the Fast Food listings, is because there is an elaborate Gypsy Spy Network which has tapped into the kiosk system at many fast food locations... they have gone as far as using the francise's own nationwide computer networks to distribute their own communications to the locations.

These communications are AM encoded on top of the standard FM transmissions which you would expect to hear... you know... the standard "You want fries with that?" stuff...

I have yet to actually crack the code used, but given enough time, I will be able to decode the seemingly unsuspicious rise and fall of the carrier amplitude, and have the communications decoded to my computer screen.

So far, I have analyzed the front porch sweep of the signal, as well as the intermediate ramping following the start bit and the 10 data bits. There is a secondary ramping just prior (1/46 ms) to the back porch following the stop bit. The coding in this secondary ramping has me still clueless as to the extraction of the byte checksum. Any help would be appreciated.

I hope we can get the final decoding formula completed and written into the software before the gypsies proceed to phase three. I already get the feeling that they are closely observing me at times. I hope it's not too late.

>

I can tell all of you, that the folks who man the Radio Shack stores, are in no way "trained" to provide correct answers. Upon my retirement from the USAF, I thought I would give my local Radio Shaft store a shot. Pay was $4.25 per hour, with a useless promise of something called "commission". By the time the upper level of management works the numbers, you usually end up standing on your feet all day for about 9 hours and earning well less than $180 a week.

You will make more money at any Burger joint. Remember that the ad's claim "you got question's, we got answers", they never even try to claim that the answers given are in any way correct.

>> I once put in a application at a local R/S for the fun of it.
>>The store manager told me that they did not need anybody that knew
>>anything they wanted people with Sales skills. (?)
>
Great that your Radio Shaft manager was so up front with you. What they mean is that they teach you to sell batteries with each flashlight, extra speaker wires with each stereo, etc. etc. What I really hate is when they ask you for your Name, address, phone number, etc. Pay in cash and tell em your name is Charles Tandy! BTW, I know of no better place to go buy electronic bits. My complaints are with the compensation given to their so called and self proclaimed "experts with the answers". You can get better answers from the guy at the burger joint from my experience...

Ironicaly, this all makes sense. ;-)

So why do you feel a RS employee should make the same amount of
money as a fast food worker, when the fast food worker gives
better answers? <grin>

I gotta agree with you on this one. The only idea I could come up with is that they are fast food abusers. Maybe someone
needs to start a Fast Food Anonymous. Counselors could be located at the ordering kiosk. Which means they would also have
to add an emergency exit lane from the drive-thru.

4120. Re: Radar Jammers Work?

Newsgroup: rec.radio.scanner
Date: 1996-02-21 00:00:00 UTC
From: david.cimperman@cleham.org
Message-ID: <8BB32BE.001F0055B5.uuout@cleham.org>
Source record: 239509

It seems you don't understand the whole picture.....Owning a Gun in most cases is OK, carrying it into your local High School is not, owning a Radio Transmitter in most cases is OK, using it to transmit on freq'q you have no authority on is nt, using it to cause interfearence is not OK, If I remember correctly, FCC says we cannot cause intentional interfearence to other stations, Police Radar is a Legal station. As far as the Police deciding if somthing is Illigal, yes they can to some extent, I as a Police Officer do make that kind of judgment call from time to time, If I'm wrong, I have to answer for it, If I shoot someone who pulls a weapon, and it turns out he was another cop, I have to justifie it, If I arrest someone who was jamming my radar, and his equipment was legal, I have to justifie why I arrested him for using it in a Illigal manner. As far as the speeding ticket compared to Obstruction charge (Here In Ohio) Speeding 10-15 MPH over costs you $73.00, no big deal, but yes your insurance will go up, and you may be late.....Obstruction charge will get you a trip to the station, your car towed, and if your from out of town, you will be required to post bond before I let you leave the station (I.E. your arrested, and held untill you post bond, or go to court, in our court that is Mon, Wed, Fri, If you get picked up on Fri After 1 PM, you sit all week end) Most of us could care less if you mess with the speeders, and set off the radar detectors, but you interfear with a Police Officer From doing yout you pay him for, is another matter entirly.....
It may be a joke to you, but traffic stops in most of the smaller, and mid sized towns result in more felony arrests that anyone but a cop will believe, think about who you are helping, If your helping yourself, how far of a jump is it to helping a suspect beat up a cop, to get away, and then think about what you will say to the cop who lets speders go, when that speeder wreckes his car into your house, or your child playing in your front yard.

Forgive the spelling errors, I have a habit of typing too fast for my fingers to keep up

Around here only about half of the cell phones still get repeated by the
base. It's really quite annoying. I guess it's a good way to discourage
scanner listeners.

I need a 2 channel UHF Motorola Minitor II pager. Must be 2 channel. Unit should cover the 460/463 Mhz frequency randge. Can be either carrier squelch only or tone alert model. Not interested in Directors or Pagecoms. I have a low band carrier squelch only model (33.78/33.94) that I would be willing to trade if anyone is interested.

Please contact me via email/phone only:

coopermj@dca.net or coopermj@gg.dupont.com

Mine is 9.7 Volts open-ended. If I connect the scanner and switch
it on, it goes down to about 9.3 Volts. I guess the condition/age
and charge status of the NiCads would have some effect on the output
voltage of the power pack (I had just charged mine up a couple of
days ago, before measuring the voltage for you).

Ron Katz up in Toronto is serving up RealAudio, but his ISP doesn't support it correctly, so
the files download completely before they start playing. His URL is:

www.interlog.com/~ronkatz/

My page has .wav files available for download. The address:

www.frontiernet.net/~dstark/

I would also be interested in finding other sites that have scanner audio!

Oppps Everything still stands the same except the part about
the line pulling to a logic low. this is caused by leaving the
sound squelch not being isolated.

Problem still is the same though. Circuit decodes but scanner will
not continue scanning. Force line high and hold it there and it still
does not continue.

The only mod to the scanner is cutting the navy blue wire and
isolating it only to the dsq mod via a diode as per the instructions.

Things to think about the BC200XLT:

1) If the unit works when plugged in to the AC adapter, the probability that the charging circuit works is high.

2) Yes, some bands use more current then the others, 800 MHz on up especially.

3) If you have had your pack for about five or more years, the nicad cells probably need replacing. There is an outfit in NY called BatteryTech that sells this for about $20-30. They advertise in photo and video magazines. Note you have to disassemble the pack, unsolder the old nicads, and solder in the new ones.

NRG>I was wondering if i am the only one who likes the R-1. Everytime i post
NRG>anything about it, i get some DICKHEAD flaiming it saying how much the
NRG>radio sucks.Though I owned one, and with either the supplied duckie, or
NRG>a scout-type antenna It was fine. There was intermod, but what do you
NRG>expect from something so small? (ever try a kenwood TH78a?)

NRG>Don't post here if you intend to bitch about how much you hate the R-1.
NRG>(Get your own damn thread!)

I never owned one, but what stopped me was the following:
1) Wideband with no sideband
2) No banks, i.e. all the freqs are in one bank
3) Fancy battery pack (give me AAs any day)

I do own a TH78A and no what you mean about intermod. However, it
only has real trouble when you do odd stuff such as put a high
gain antenna on it or hike in the hills near powerful transmitters.

When I was writing for MODERN ELECTRONICS magazine, a kid from Kentucky sent me a letter about how he had been "arrested" for having a Radio Shack handheld scanner, and just walking around with it. He was under 16 years old and couldn't drive a car.

Fortunately, it was new and he was able to return it to Radio Shack and get a "base" type scanner. Also, fortunately, after taking him to the station and "roughing him up" (a little verbal intimidation), they didn't charge him with anything. UNFORTUNATELY, he was living with an aunt who already had misgivings about his new hobby, and this episode didn't endear it to her.

>AB4YR

Only Pro-2026 scanners manufactured before April 1994 are modifiable in that way. The newer ones are not. Look at the white date code sticker on the box end-flap and on the rear of the scanner.

Mine was "11A3", which decodes to November 1993 (and was modifiable). The code is that the first numeric characters are the month, the alpha character is a separator, and the final numberic character is the last numeral of the year. "7A4" (for example) would be be July 1994, and manufactured after April 1994, so it is not modifiable.

Sometimes they might through a "ringer" in there, but I have found the date code to be a reliable gauge in this matter on this particular model.

What he is asking is: since his scanner only tunes in 5kHz increments, is
there anything between those 5kHz increments? No there isn't. Even if
there was something on 44.7525, you would hear the transmission almost
perfectly on 44.755 or 44.750.

I remember reading a post a while back where someone had 'discovered' that the Uniden 900MHz Spread Spectrum phones had a ~400MHz leak that was scannable. Before I set up an experiment, does someone have that mail? Or know what I am talking about? Thanks...

4162. HELP WITH TONES ON 800 MHZ TRUNK SYSTEM

Newsgroup: rec.radio.scanner
Date: 1996-02-21 00:00:00 UTC
From: Chief Doug Hamer <rivefire@nbnet.nb.ca>
Message-ID: <4ge70a$ak7@darwin.nbnet.nb.ca>
Source record: 239567

An area 800 mhz trunk system has recently added a 1250 mhz tone of
about 7 sec duration running every 30 seconds to attempt to thwart
monitoring (or require them to medicate with prozac).
The system is utilized by about 6 - 10 users including some public
safety (pd, fd etc) on a fairly limited number of frequency, The
changing os the data channel every 24 hours was not a big problem...
this is ??
Any suggestions how to get around it . Monitoring myself on a Radio
Shack 2006. Great Box !!

: i think its funny

Even easier is to speed, but only if the cars in front of you for about 1/2 mile or so are also speeding. That way, if the cops aim a radar or laser gun at someone, they will get the cars in front of you, not you. And besides, the cars in front of you will see the cops if there are any out there and slow down, you will see their brake lights and slow down too.

If there is no one in front of you, just set your cruise control about 7mph above the limit and relax.

Besides, radar guns don't cause cancer, they operate on microwaves. Gamma rays are the ones which cause cancer. Unfortunately, the bulk of the population is so scientifically illiterate they think microwaves and gamma rays are almost the same thing. After all, they are both invisible forms of radiation, aren't they?

There are scanner laws in all 50 states. The range is from New York, where I believe the police can confiscate your scanner, to other states where as long as you don't get in anyone's way or commit a crime, you're OK.

Even in those states where mobile scanners are completely illegal, if you have a valid AMATEUR RADIO LICENSE, then its NO PROBLEM!

Check with RCMA magazine for a complete rundown of state scanner laws.

Source record: 239579

I had the case off of my scanner the other day (the warranty is no longer any good, anyway) and it didn't seem to be too bad in there. I was wondering if anyone knows of any 800Mhz mods for this scanner. I am sure that this question has been asked before, but I don't recall every seeing a definitive answer on the topic. Incidently, there was like a daughterboard in there that said 800Mhz unit on it. Almost looks like it was added as an afterthought.

Thanks. Mike

4177. Bill Cheek DSQ Mod Problems

Newsgroup: rec.radio.scanner
Date: 1996-02-21 00:00:00 UTC
From: ronkatz@interlog.com
Message-ID: <4gf40d$ba0@steel.interlog.com>
Source record: 239582

Again I've attempted to make the DSQ Mod in Bill Cheeks book work with no success.

The mod works ok but the hookup information for the 2004 and 2006 seems to be incorrect. What happens is when I connect the output of the circuit to the Sound Squelch line as per the instructions I notice that the voltage never goes higher then about 0.5 volts. If I disconnect it then I get the normal switching from 0 volts to 5 volts.

What is happening is the circuit is being loaded down and even changing the resistor from pin 2 to 3 from a 3.3k ohms to a 1k ohms the same occures.

I found this to be true in both the 2004 and the 2006 other tests and studying the Schematic Diag for the 2004 Scanner it seems like this is not the correct method of telling the scanner to continue to scan and or mute.

On the DSQ mod it shows that it should be hooked up to the Sky Blue wire after being cut to the Logic/CPU Board. This is what I have done and even trying to pull the line high with a 1k resistor to a 5volt source the same results are obtained.

Any comments or suggestions??

>the tech manual nor do I wish to tune it up myself.

>SGIRON@is.arco.com

First of all, I have tried answering your e-mails, but can't get a
single one of the many I tried to go through. The following is
typical of the Mailer Daemon error returns I get:

==========
---------------------- Failed addresses follow: ---------------------|
<SGIRON@is.Arco.COM>...transport inet_zone_smtp: connect: No route to
host
==========

Apparently you can send e-mail, but I bet you have a problem receiving
it. Check with your ISP, please. I've had a number of emails
returned because there is no route to your host.

Now to answer your PRO-43 question: Radio Shack Service centers are
not known to undo customer work, notably cellular mods. The techs
don't care one way or the other. They just work there. If your mod
has something to do with the problem, then there could be a
difficulty, but the cell mod alone causes no problem and they are not
likely to notice it. Doubtful they will work down to the Logic/CPU
board level anyway. Your problem sounds like it's up on one of the
higher boards anyway.

If "poor reception" is the problem, take a look at the antenna
connector where it solders inside the unit. Whoever did the cell mod
may have forgotten to resolder that connection. Also, the BNC antenna
connector can fail, especially in the poorly designed two-pronged
center conductor pins. Examine that area carefully before pushing the
panic button.

Rgds,

Bill

Try Cincinnati Microwave's Escort series. All their 900Mhz phones
are Spread Spectrum. To my knowledge, there aren't any descrambler
kits out for those phones at all. I've owned my Escort for better than
a year and haven't ever heard the first blip of my conversations on
the 900Mhz + range.

Bill,
I'd seen the same thing happen with a friend's Pro-43. After he'd
performed the cell mod. and beep deletion, he was so excitied about
turning it on to listen to it, he'd overlooked resoldering the antenna
connection to the board. After Fed-xing it to me to fiqure out what
he'd done wrong, I told him what it was and he couldn't believe it. I
guess it's best to check the easys out first, ehh??

Source record: 239393

I have a PRO2032 and I know it is modifiable for 30-54 Mc (LOW VHF). In Sweden (where I live) the model comes with 68-88 Mc instead of the low VHF. The step in this band i 5kc's wich is useless as 99% of the interesting frequencies are offset. So, is there a way to "restore" this low-VHF?

Electronic greetings, Jann

I've been involved with electronics for several decades. I've done bench service, field service, I am an active amateur radio operator and professionally a senior technician. I may not know as much as some folks and certainly not as much as I wish I did but I know a few things about electronics.

I also worked part-time for Radio Shack for three years ('93-'95).

At the start I'd do what I could to answer ANY technical question. I'd help people select resistors and transistors. I'd review their plans and offer alternative ways to build their little projects.

It took me quite a few months to understand that Radio Shack really doesn't want or need super techs standing around chatting with the customers. They need salespersons who have the technical background necessary to close a sale.

Prior to learning that I was nearly always earning the hourly rate. My co-workers were getting the good sales while I talked shop. After learning that fact of life I was nearly always in commission. The system is set up to reward good salespersons. I swallowed my professional pride and worked toward being a better salesman.

In 15 minutes time I could chat with an electronics hobbiest and sell him $8 worth of parts for minimum wage or I could chat with someone else and sell him $250 worth of scanner and accessories at 6.6% commission.

Can I help who's next? You need a fuse? They're in the back.
Can I help you sir? No, I don't what PNP means. Will that be all?
Can I help you? Yes, we have the new DSS. Did you know that it.....

Hi,

If anyone has any experience scanning in a foreign country (say, in Asia or Europe), please e-mail me at chiamkh@engin.umich.edu.

In particular, I would like to know if the frequencies used are the same as those used in the United States, and if a U.S.-manufactured scanner, such as the ICOM R100 or the BC9000XLT are recommendable (in terms of frequency coverage, power supply, etc.).

Thanks in advance,

Keng-Hwee

> seem to ignore.

I was in the drive thru of a Micky-D's quite a while back, and overheard one of the gals make a rude comment about the guy in front of me. When I got to the window, I leaned over and told her, "You're right". She said, "Im sorry, right about what?" "You're right about that guy being an a$$hole, how rude!" I replied.
She turned as red as a rose, and just gasped. I showed her the radio and told her that I can hear them for at least 2 miles, whether it's to the drive thru or between headsets.
She didn't believe me at first, so I turned up the radio and had her say something. SCREECH! She heard her voice along with the feedback and nearly fainted.

I never did hear those kinds of comments again. Was it something I said?

Source record: 239406

So...why don't they design the phone to call another without needing to go through the network. Therefore bypassing any toll charges.I'll tell you why because it is a scam. By forcing you into the network they are able to charge you. Also cloning a phone if you use the trunking system analogy means that you can have many means of accessing the service that you paid for! Good luck on your crusade.

I don't know Jack, but I'll tell you anyway! <pun intended>

Disregard the color sticker on the outside of the box, AND the "B" on the Radio Shack part number, these are virtually meaningless in my experience. Look at the date code on the rear-panel of the scanner itself. The first numeric digits are the month, the alpha character is a separator, and the last numeric character is the year.

My unit had a date code of 11A3, which is November 1993, and is modifiable. Any scanner manufactured after April 1994 will not be modifiable. I saw this in a Pro-2026 with a date code of 7A4.

There are several different mods floating about, your mileage may vary.

If the Pro-2026 you are looking at has a captive 12Vdc cable (not disconnectable) and has the "Patrolman" label on the front panel instead of "Radio Shack", pass it by. This is the older model that will forget all programming IMMEDIATELY after disconnecting it from DC power (which is why the cable is built-in).

The newer models can be disconnected from DC power for up to 2 weeks without losing the programming.

Any elecromagnetic radiation in high enough dose is dangerous. A microwave
oven can be dangerous. Most consumer RF devices have sufficiently low
power to be fairly safe. There have been several cases of cops who develop
cancer after 15 years or so of using radar guns.

4212. Oakland, PD 800 mhz trunked frequencies

Newsgroup: rec.radio.scanner
Date: 1996-02-22 00:00:00 UTC
From: Dyee@ebmud.com
Message-ID: <4ggflf$76v@lal.interserv.net>
Source record: 239445

Can anyone provide me with the frequencies used by the Oakland, CA Police department
800 mhz trunked system. Also what methods or circuits can get around the tone that keeps
the
carrier on after the transmisson has changed to another channel.

Thanks, Darryl dyee@ebmud.com

4213. Police Data equipment ???

Hi All,

Does anybody know what type of equipment (manufacturer, models, e.t.c.) police departments of different countries use for transmission of data and voice. What kind of data transmission equipment is installed in police cars for connecting to police databeses, for transmitting different kinds of queris to dispatchers and to control centers. What type of computers and communicators police use in police cars ?

We have clients in Russia-police department of one of the biggest Russian cities. They ask us to develop some test network for mobile and non-mobile police patrols.
As I think, the best way for us - to investigate what type of equipment is used in oyher countries.

P.S. For non-mobile we are going to use a Multipoint Inc. equipment.

Please E-Mail me.

Thanks for advance.
Best regards.

Oleg V. Melnikov

Once again, I propose the following offer:
Evertime the POCSAG info is posted, there are a flurry of postings
afterwards from people who cant or do not want to build the interface...
I have sucessfully built the reqired interface many times, and tested
it with both PD-102 and PD-200.
I have the output from my scanner's speaker (A bearcat 100XLT, but my
PRO-34 works fine too) wired to the circuit and it has recieved no errors
so far...
I will build the circuit for you for 50 dollars. Your choice of
connectors pre-assembled onto the board for only the cost of the
connectors.
Interested? Email me at: sf3362@cnsvax.albany.edu
Thanx.

>BTW, I do own an early model R7100 and would not even consider taking
>$1000 for it.

Oh sure base your opinion on experience and knowledge. I bet if you had a database of 3 sales you wouldn't feel that way. :-)

Seriously Dave, I have heard from a number of people that feel the same way concerning the R7000 comapred to the R7100. A couple of them sold their 7000 to get a R7100 only to sell it and buy a 7000 again. Not a good indicator for the 7100 is it? It also leads one to think that the price of a used 7100 should be lower than a 7000.

I too own an early model R7000. It is going to have to be hard times before I let loose of it for under a $1000. Those that own one know and those that pretend to track these things by threes are just guessing.

I have designed a web page for my favorite scanner the Pro-2006
its at

http://yrkpa.kias.com/~stevehan

It has information on the Pro-2006 in one central location including
hardware, software and publication links for the unit.
Also I design a page for my favorite software on the OptoScan456, Probe
by Datafile. Later the Probe page will include Tips and hints not found
in the manuel and probe files you can download and import into your
Probe software. The new verison 2.0 makes this a lot easier.
The probe link is

http://yrkpa.kias.com/~stevehan/probe.html

If you have any suggestions or comments about the page let me know.
Thanks for listening.

From: joolson@ccgate.dp.beckman.com
Message-ID: <4gi4ba$qbp@inet.dp.beckman.com>
Source record: 239464

I constructed a home-made Discone antenna from instructions sent to me by John Mace (thanks John if your still out there) in this news group. It uses 12 ga solid copper wire from the hardware store and a PVC cap as the mount. I am using 25 ft of RG6 from Rat-shack and have

it mounted in the rafters of my garage. It is a tremendous improvement over the rubber duckie.

I get Police mobiles clearly from a town 35 miles away and county sheriff services 90 miles away. I haven't had the chance to experiment with different lengths and configurations on this antenna. I'm going to try RG8 and compare results as there seems to be differing opinions in this group as to the most efficient cable to use.

I will be experimenting with different mobile antennas also, including CB mag mounts.

Also, just for info. I had a PRO60 and PRO51 side by side for comparison to decide which one to buy. The 51 definitely had the best sensitivity. It picked up channels that would not even break squelch on the 60. The higher scan speed on the 51 also set my decision to buy the 51.

Let me know if you need more info.

These fast food headset radios are not only used for taking the
customer orders. They are also used by the employees for just talking
between each other. And sometimes they make 'interesting' comments about
the customers, or on really slow nights I have heard some very risque
discussions about the party someone was at the night before, etc.
It's just one more facet of radio voyeurism that some people can't
seem to ignore.

There's half an hour wait at the drive through booth. You listen in for an order you like, then slip up to the window before the REAL customer get's there. You still have to pay, but you know the price and it's a lot faster than waiting in line.

4237. AR8000 cell mod

Newsgroup: rec.radio.scanner
Date: 1996-02-22 00:00:00 UTC
From: 00496-OEM-0008733-5911@msn.com
Message-ID: <00001ff6+000048a5@msn.com>
Source record: 239470

Excellent radio, I have one. Cell restoration is possible. Monitoring
Times and Popular Communications
magazines have advitisers that will do the mod for $40.
I haven't had it done because I also own an AR1000 that
has cellular.
Take care
bob

No.
I would return it for another one.
I have the older bc2500xlt. It received better that my
pro-2004. the sensitivity on our radios are the same.
Good luck
Bob

Once again, you're spot on. Look up 'wanna-be' in the dictionary and you
get a picture of Glenn Hansen gazing longingly at Bill Geek. He has
adopted Geeks manner of speech, no less! Talk about picking questionable
role models....

My old Pro-35 can be given a lower and upper limit and told to look between
them. If you programmed the boundaries for cellular, it could search between
them and find any cellular calls, except the Pro-35 tops out at 512Mhz :-(.

I take your point, though - it would still only get one side. By the time
a second scanner had found the other frequency, the conversation would be
over.

>
> Tal..

They are "Dual Tone, Multi Frequency" tones or 'Touch Tones" like on your telephone. One advantage to haveing a decoder is to
check the encoder in a Ham rig or a pocket dialer. Another would be to intercept (cool word) tones from cordless and cellular
phones. Not to give out any ideas (because the bad guys allready know this) but they can sometimes intercept* transmissions that
are from people calling the bank or a similar institution, that has an automated account ballance system. Not only will you get
the account/card number, but the pin and everything else. Thats one reason why you DON'T use cellular/cordless technology to do
anything that means sending sensitive information without encryption.

* Standard disclaimer.

Rob

4244. bc3000xlt - mine was a lemon (follow-up)

Newsgroup: rec.radio.scanner
Date: 1996-02-22 00:00:00 UTC
From: bnr@universe.digex.net
Message-ID: <4ghq8i$hnk@news4.digex.net>
Source record: 239477

About a week ago I posted an article regarding my new bc3000xlt which didn't function properly. I'm happy to report it was in fact just that particular scanner. I have since rec'd a replacement and it works perfectly.

My advice to all would still be to test those new scanners. Line them up with your old scanner (or a friend's) and test them out. It was a strange problem I had and I caught it the first day I had the scanner (therefore it was easy to exchange).

One thing I did pick up that I was not aware of before (and is not in the manual) is the light trick (thanks Gary Wilburn). If you hold down the light button when you turn the scanner on - you can then toggle the light on and off (it overrides the 15 second timeout). I have seen vendors and mail order companies offer this mod for around $30!!! NO MOD NEEDED!!! The scanner will stay in this mode until you hold down the light button and turn the scanner on again. Then it returns to the 15 second timeout mode.

If anyone knows of any more of these little tricks with the 3000 - please let me know.

Many thanks to all who replied via private e-mail with their thoughts and suggestions.

Good Scanning!

When the Motorola phones are in test mode, you can enter the channel
you want to listen to via a keypad sequence, so the 'celltracker'
program hooks onto the data line of the handset and sends the codes to
the phone for you, while decoding the data picked off the NRZ data
and CLOCK lines from inside the phone, so it knows where and when to
change channel to follow a particular call, but I never got it to
control the phone, although it would tell me where the call went, I had
to punch the code in by hand to change channels.If anyone wants the
details, I'll post them.

4248. GOLAY (GSC) Pager Decoding

Newsgroup: rec.radio.scanner
Date: 1996-02-22 00:00:00 UTC
From: cagey@indigo.ie
Message-ID: <4ghs81$2v1@niamh.indigo.ie>
Source record: 239481
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have PD-102 and the associated circuit which decodes POCSAG pager
transmissions. However, I am looking for software which will decode
GOLAY (otherwise known as GSC) transmissions (preferably Shareware).

I know that Message Tracker is meant to do this but it is a bit pricey
and it is not available here.

Ta in advance!

4249. WTB: Two scanners with 800 MHz, cellular coverage not needed

Newsgroup: rec.radio.scanner
Date: 1996-02-22 00:00:00 UTC
From: QRP%mimi@magic.itg.ti.com
Message-ID: <4ghsif$dpa@mksrv1.dseg.ti.com>
Source record: 239482
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.scanner

My local police and fire departments are getting ready to switch from high VHF and UHF to 800 MHz, and I don't have a scanner that will receive 800 MHz. Serious bummer! I don't need anything fancy, and I don't want to spend lots of money. I couldn't care less if the cellular bands are un-blocked, as I have no desire to eaves-drop on peoples' private conversations. I'd like to find one handheld and one desk top scanners which cover the following bands:

29 - 54, 108 - 136, 136 - 174, 406 - 512, 800 - 900

The handheld must accept NiCd batteries. The desk top must run on 115 VAC and 13.8 VDC. Anything I buy will be in nice condition, with no modifications, and with manual (and preferably with the original boxes, packing, etc). Whatcha got that I can use? Please e-mail or phone me.
Thanks!

Here in San Diego we have a club with over 800 members -- many many with No-Code Tech Licenses. I and many many others think the No code licenses are a great addition to Amateur Radio. See my articles of accomplishments of same.

As for big gun stations -- we have a group of QRPers here, several who have worked DXCC (all CW or SSB) with less than 5 watts and modest antennas such as a Cushcraft R5 mounted 8 foot off the ground. Not easy or for the faint-hearted but DEFINITELY achievable.

Don't let a few "bug" you when the majority welcomes you.

But:

You can get further with a wet noodle and a linear than you can with just a wet noodle -- Big Al from Chicago!

What should I expect to pay?

4259. Re: Problem for "experts" in scanning and shortwave!

Newsgroup: rec.radio.scanner
Date: 1996-02-23 00:00:00 UTC
From: ukfan1a@aol.com
Message-ID: <4glsbf$g9u@newsbf02.news.aol.com>
Source record: 239293

I'm not sure about what you're saying, but I beleive that I've found the problem, and have even raised more questions!

Earlier in the month, I'd been getting strange RF-like interference with the 2 line phone. This is ok, because it was weak, and sounded like radio frequencies or something. At first, I thought it went along with problems in the line. However, the other night I was listening to my scanner in the 46.mhz range (46.745, or .845 I beleive) and was able to hear someone in my family talking on the phone to someone just up the street. The person up the street wasn't on a cordless, and if he had been, I would have picked up the call on a slightly different channel, and a LOT stronger than the vague signal I was getting. I checked into this later by picking up on the phone, and listening to the same channel on my scanner. I could hear dialtone, and every button pushed!

My theory is that these phones use slight transmission on their lines, to allow conferencing on the 2 different lines. This also makes them suceptible <sp> to radio interference.

Still working though!
Let me know if you can help!

4260. Re: WHY CELLULAR?

>Radio Shack told me it wouldn't work. Any ideas?

First a TV antenna is horizontal, most scanners uses use vertical
polariation. Second, a TV feedline is 75 ohm, your scanner is 50 ohm.
Third, the lowest frequency your TV antenna is designed for is Channel 2, or
56 Mhz.

However, even with these differences, it still may work better than the
rubber duck antennna at ground level. It can't hurt to try. You'll probably
find different perfromance comparisons depending upon frequency.

Hi,

I'm looking for a high-quality earphone for use with my scanner to allow me to discreetly listen to my scanner with one ear without losing complete touch with what's going on around me. I need something that'll comfortably fit in my ear and stay there; I've tried the hearing-aid style earphones that everyone sells but I can't find one that fits well. I've seen Sony single-ear earphones that look like they're much higher quality but can't find them for sale anywhere.

Does anyone have experience with a good earphone?

Thanks in advance,
-Patrick Penzias Dirks.

Source record: 239340
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I tried the PRO60 and PRO51 side-by-side to see which one I should buy. The 51 (avg .5 uv sensitivity) was far more sensitive than the 60 (avg 1uv sensitivity) and the faster scan speed helped me decide on

it. The 51 would pick up transmissions that would not even break squelch on the 60.

The 51 is small enough to carry in my shirt pocket with an earphone. It also gets acceptable reception in the car using the "duckie" antenna. Also, I can run it 14-15 hrs, using the earphone, on a fully charged set of nicads (AAA size). The nicads charge from the DC adapter while still in the scanner, so you can be listening while the nicads are charging and just unplug it and go whenever. The optional real leather carry case, $20 (too much, but necessary), is thin enough to still keep the unit in my pocket and seems well made.

I constructed a home-made Discone antenna and hung it from the rafters in my garage and can now get excellent reception even in the 30-50 mhz area. I listen to PD in a town 35 miles away and pick up County sheriff 90 miles away.

The unit I bought 2 months ago (11A3 date code) from Rat Shack still allowed the keyboard cell freq mod, although I don't even use it. I paid $200 on sale for it and it is a very good unit for me. Don't think I would pay normal price of $320 for it though.

The only minus, IMHO, is that it is sometimes hard to read the display because of glare. They should install some kind of polarizing lens instead of plain plastic.

Jonathan,
I have a combination digital answering machine and 900 MHz
cordless phone. I turn on the intercom, and put near TV and
started scanning, I picked up the TV sound. so it isn't safe from
scanners. from what I understand if the 900MHz (Mhz?) phone
itself is digital or spread spectrum, it is safe from normall
scanners. but there are analog 900 MHz phones out there
so be careful in purchasing..

>BTW 20 banks of 10 channels are better than 10 banks of 20 channels.

Memory is CHEAP these days - since it's going to have full
upload/download ability to a PC serail port, and alphanumeric ability
(so the display says "LA FIRE DISP", etc), lets have 50 banks of 15.
This way I can load up all my LA frequencies AND all my San Diego AND
all my Portland Oregon stuff so one business trip to all 3 cities
means one upload.

And a mode where I can essentially say "search from xxx.xxx to yyy.yyy,
and whatever breaks the sq store in Banks 1, 2, 3,and 4 but no dupes.
And count the hits both as hits and as total unsquelched time".
Handy at airshows, etc. for the first couple of hours.

4293. I SELL A AOR-AR8000 with interface

Newsgroup: rec.radio.scanner
Date: 1996-02-23 00:00:00 UTC
From: pub01201@innet.be
Message-ID: <312dae98.5006609@news.innet.be>
Source record: 239359

Hallo all,
A friend of me (without modem) sells his ar-aor8000 scanner, 1 year
old, with manual in dutch and english, interface and soft for pc.
New price: 26000 bfr (860 US$)
Price now: all together (500 US$) without shipping
Bought in the Netherlands, 1 year ago.

Comments and info only at e-mail: Sven.DeTroch@innet.be

Greetings, SDT

4294. Poor reception on Pro-34 in 30-50 range

My Pro 34 has poor reception in the low freq ranges. It did this when new and they repaired the solder connection on the antenna. However, the solder connection looks fine.

Does anybody have any ideas?

PDs in Kentucky call it "Inter City." Only dispatchers typically have
radios for this frequency and the statewide law enforcement computer
network (LINK) has all but made it obsolete, except for the state
police.

The allocation for railroads by the FCC is:

160.215 - 161.565MHz, 15kHz step. I have programmed this search range into my scanner rather than programming every frequency in this range. Hope this helps.

Mike

Calling another cell phone without the network would be a little hard.
You'd have to be only a couple of miles apart otherwise you won't get a
thing. So you'd be better off buying a CB to talk to your friend. How
about stringing up wire between you neighbors house and you so you can
call on regular phones without the network.

>mark s. conway

I don't know about "best", but I have found the AEA ACARS kit to work well, and the manual is very good, with a lot of good information to help you decipher some of the data.

The AEA ACARS kit can be ordered through any AEA dealer (Ham Radio shops, typically) for about $90 if they discount. AEA sells it direct for $149. They have a web site, so you can get some preliminary info there.

I was satisfied with my purchase of it. It isn't a "glitzy" product, but it works well. I have it hooked up to a Radio Shack Pro-2026 (dual conversion, inexpensive scanner) and it works great.

I am 20 miles away from the airport (PDX), so I usually only get the aircraft-side of the transmissions using an internal whip antenna.

)Anyone have formulas for 1/2 and full wave?
)
)
)Thanks Again,
) Steve Passmore
) spassmo@cello.gina.calstate.edu

The speed of electromagnetic wave propagation in free space is almost
exactly 3x10^8 meters/second. Since frequency x wavelength = propagation
speed, all you need to do is divide.

(161 x 10^6)/second x (wavelength) = (3 x 10^8) meters/second

so

wavelength = 1.86 meters = 6.11 feet = 6'1.4"

wavelength/2 = 0.932 meters = 3.06 feet = 3'0.7"

wavelength/4 = 0.466 meters = 1.53 feet = 1'6.3" or 18.3"

The speed of propagation in the -wire- is somewhat lower, so you might
want to cut about 10%-20% longer, and then trim.

) |-----------------------------------------------------|

[Rest cut.]

When I first began investigating modding my 855, I tried what you list
here (minus the resistor, just jumpered). I found that it caused the
stored channels to be dumped when the machine was turned off. The cause
is that the holding capacitor is being discharged through the diode.
Naturally, the use of a resistor would increase the discharge time, but
you are still discharging the holding capacitor. If you remove the
jumpers from the top and replace them with alternate jumpers on the
bottom, you will not have a problem with losing your program.
```

I have a small document on that, as well as a couple of keyboard hacks.

At least for cellphone systems they do not stay in one place, but switch between several frequencies every so often to distribute the wear and tear on the transmitter (that is what I have heard).

You can always tell the control channel by the digital roaring sound you hear. Most annoying. It sounds like a loud diesel engine.

Mike

Hi,

I am thinking about buying a new one of these at Radio Shack for $149.99. Can it be modified for the cellular band?

Thanks!

4317. Seattle North Tac Freq?

But do you know you didn't pick up the TV sound from the TV itself? I was trying to scan all of my portable phones (not at once) and I picked up the sound from the TV. I turned off the phone and changed the TV channel and the sound I picked up changed as well. It appeared that I was getting the sound from the TV somehow. I thought it was interesting.
I have an AT&T 900 mhz phone and I couldn't pick it up and I scanned through the entire band twice. Oh well.

One of the things I haven't seen mentioned is to find the 17 cell
channels on the cell site nearest you and scan those. Scan all 34
channels if you want both wire/non-wireline. The inputs are good to
scan if you only want signals in the *immediate* vacinity. Depending
on the site configuration, you can usually find channels spaced 630 KHz
apart. Freqs are between 869-894 (site) and 824-849 (mobile).

NEVER, EVER send money to anyone just for a mod. Mods can very easily be
found on all kinds of web pages and such. It's like the cable descrambler
scam. Sure you can build a descrambler for $10, but it's of no use now,
maybe back in the 70's or something.

ForSale:

OptoElectronics APS-104 Active Pre-Selector
-Tunable band pass filter system
-10MHz to 1GHz
-Continously tunes over more than 5 octaves
-Maintains a constant 4MHz bandwidth over entire range
-Electronically tunes
-Ultimate Security Sweeper
-Extend Near Field detection distance 10x
-Includes Internal Rechargable battery pack and charger

New this is $1000 from Opto, I am asking $750 or best offer

The unit is in perfect conditon, and has seen very little use.

The perfect use for this is in conjunction with the Scout or Interceptor,
it provides a very significant boost in capture range.

I was using it with the Scout/AOR-8000 combo and it worked great.

I purchased this for a project and no longer need it.

> like that?
>
> Just wondering

Two possibilities
1. The designer wanted to allow for a speed increase for next year's "deluxe" model. Marketroid mentality at work. :-|
2. (more likely) As the radio scans, it must read its static RAM & load data into its PLL's RAM chips used to be slower than they are now and the PLL's also have a maximum load clock rate and a certain settling time. It could well be that the designer saw fit to allow the CPU to be throttled back to allow use of slower (easier to get by the thousands) parts, and by the time of the 2005, the parts would support full speed operation. I have not explored the 2006 with a scope to find which timings are affected by the diode. If anyone has, I'd be curious to know more...

Within European Union, police and other officials are supposed to
adopt TETRA network - though there is some doubt whether all
countries will do that

Using Alta Vista search http://www.altavista.digital.com/
(keywords +tetra +radio +network), I found several references
to the standard itself and some equipment manufacturers

For starters, see
http://www.comnets.rwth-aachen.de/~movie/script_engl/node66.html
for the standards information

I have one. Here's complete construction details.

1. Tune your FM radio to a "beautiful music" or "easy jazz" station.
2. Locate the AC line cord and disconnect it from the power source.
3. Cut the AC line cord off as close to the FM radio as possible.

By the way, there is an auxilliary battery pack available for the R1
that takes six AA batteries. I think I paid about $12 for it-too much
for two pieces of molded plastic with a few metal connectors, but it
is a good investment for those of us who use our R1 constantly. Yes,
it has all of the problems that the flamers report, but it also has A
LOT OF ADVANTAGES!

You might want to check the following freqs. in the "Listing by Frequency"
section of Police Call. If you find every county in the state listed under
one, you've found a (potential) intersystem channel.

Public Safety Intersystem

Police [90.19]
39.46 intersystem operations only
45.86 intersystem operations only
155.370 (widely used, but not a Federal allocation)
155.475 statewide emergency nets
173.075 stolen vehicle recovery (LoJack)
154.665 .680 .695 } State Police
154.905 .920 .935 } coordinated
155.445 .460 .490 } operations

Fire [90.21]
45.88 intersystem, primarily base-mobile
154.265 .280 .295 mutual aid

Emergency Medical [90.27]
155.340 HEAR - Hospital Emerg. Ambul. Radio
460.525 .550 inter/intrasystem w/ Police & Fire
(also see FAF-Ambulances for MED channels)

Public Safety - all
220.8025-220.8475 Mutual Aid (5 kHz intervals) [90.720]
866.0125 .5125 }
867.0125 .5125 } Mutual Aid [90.617]
868.0125 }

(mobile freqs: 220 +1 MHz; 460 +5 MHz; 860 -45 MHz)

Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have a used BC855XLT that I'm looking to sell and I'd love for somebody to give me an idea of what it's worth. It's had the cell mod and the extra channels mod, so it now has 100 channels in 5 banks.

We bought it in December 1991 for $240. I have original packaging, manual, and antenna. It hasn't been damaged (ie dropped) in any way. The only glitch has been that the search mode suddenly started going from the upper limit down instead of from the lower up.

A comparable one (faster, of course, but without cell) at Lowe's new is about $200.

What's a fair price? I was thinking around $75. Am I ripping myself off or her?

Thanks. Please e-mail me directly if you can at whitbje@mail.auburn.edu.

Jim

> frequency, with each input using a different CTCSS tone? What would be
> the point though?

There are several reasons I can think of.
1. More than one field office or group uses this frequency, so for one field office it is the F-2 position on their radio dial, and for another it is F-5 etc.
2. A more likely reason is that one channel on their radio uses a particular PL tone and another channel (same frequency) uses a different PL tone. In addition, one may be simplex and another uses the repeater. Also one may be designated to use scrambling and another in the clear. COmbine all these and you get alot of designations for the same frequency.

I don't know why there seems to be conversations 1/2 scrambled. Maybe the dispatcher talks in the clear because some agents don't have DVP and this way they can keep track of what is going on.

: Would you mind: giving us some concrete reasons! thank u
:
I'm also a PRO-51 owner.

I have owned many RS base and portable scanners, and I must say that the PRO-51 is the best portable I have owned.

It is has much less intermod problems than the others I have owned, (I have a PRO-43 also).

Frequency coverage is good, and with the IF X 2 trick you can listen to cell phones in the 900-915 MHz range.

It also has a fast scanning rate, beeing 50 channels/sec or 100 steps/sec in scanning mode.

I like it much more than my PRO-43 which is rather useless in search mode due to intermod problems.

If anyone is looking for a RS portable scanner, I strongly suggest this one.

good listening!~

4344. Pro-2035 w/OS535 vs. Pro-2042 w/OS535 - any differences ?

Newsgroup: rec.radio.scanner
Date: 1996-02-23 00:00:00 UTC
From: bds2@psu.edu
Message-ID: <4gkrkk$dgu@hearst.cac.psu.edu>
Source record: 239434

I'd like to put together a computer-controlled scanning system. My local RatShack has the Pro-2035 on clearance for $389 (vs. list $449 in last year's catalog).

If my ultimate goal is to have an Optoscan 535 in the radio anyway, is there any reason to buy the Pro-2042 for $429-$499 (depending on source) rather than a 2035 for $389? I know about the differences in firmware between the two (better channel mgmt. and freq. duplication checking on the 2042), but my impression is that the computer control software will far exceed the capabilities of the 2042 anyway.

Any impressions or suggestions would be most appreciated!

Brett Saylor
bsaylor@psu.edu

PS: While the local store has 1 or 2 2035's in stock, none of the area stores have *any* 2042's. Are they that hard-to-get??

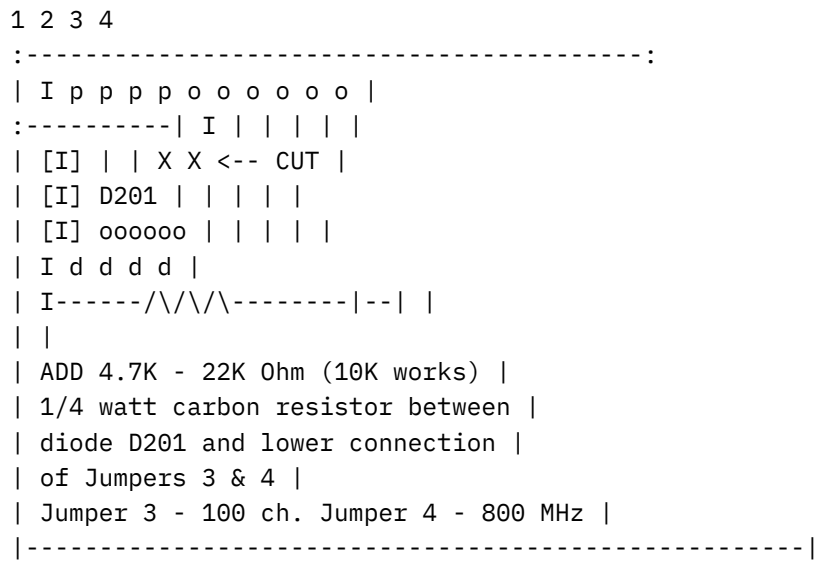
4347. BC855XLT Mods

Newsgroup: rec.radio.scanner
Date: 1996-02-23 00:00:00 UTC
From: Jim Whitbeck <whitbje@mail.auburn.edu>
Message-ID: <Pine.SOL.3.91.960222200952.17240A-100000@mallard.duc.auburn.edu>
Source record: 239437
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Someone was looking for mods for the BC855XLT scanner. Dad performed the
following on mine, and it worked like a charm. There are two: one
restores cellular, the other expands memory to 100 channels (5 banks of 20).

****
From : Glenn Cummins 1:392/6 Tue 26 Jan 93 21:03

UNIDEN BC-855XLT MODIFICATIONS
Scope of modifications:
[1] Allow continuous 800 MHz receive.
[2] Increase channel capacity from 50 to 100 ch.



1 2 3 4
I p p p p o o o o o o
I
[I]
[I] D201
[I] oooooo
I d d d d
I
X X <-- CUT
ADD 4.7K - 22K Ohm (10K works)
1/4 watt carbon resistor between
diode D201 and lower connection
of Jumpers 3 & 4
Jumper 3 - 100 ch. Jumper 4 - 800 MHz

1. Remove 5 screws from bottom of scanner case.

2. Carefully separate case top and bottom.

3. Unplug connector to the internal speaker.

4. Locate diode D201 and 4 jumpers near edge of circuit board.

5. Cut the 3rd and 4th jumpers near the middle and fold
downwulate leads, if necessary.

6. Connect the lower part of jumper 3 & 4 to one end of a 10K
Ohm 1/4 watt carbon resistor, insulate all exposed leads.

7. Connect the other resistor lead to the lower connection of
diode D201, DO NOT cut any leads on D201.

8. Make sure all exposed leads aren't touching any other
connections, insulate as required, tack in place
with a dab of RTV silicone, or low temp hot glue.

9. Reassemble scanner, make sure to plug the speaker back in.
You should now have a scanner with 100 chs. numbered 01-00
in 5 banks of 20 ch. and continuous 800 MHz coverage.

>curious as to why this is.. I mean why would the manufacturer build it
>like that?

Maybe because they had no idea what type of front end would be used
when they burnt the chip... or maybe they planned to use the same
chip for different units.

There is a drawback to using a faster scan, and that is that you might
miss some of the weaker signals which cannot be locked in on within the
time the scanner passes the frequency.

Thanks for askin'! Here it is:

Newsgroups: rec.radio.scanner,alt.radio.scanner
Subject: Mailing list for Eastern Mass.
Followup-To: sender
Summary: I've created a new mailing list.
Distribution: ne

Due to popular command I've created a new mailing list, this
list covers all of Eastern Mass from West of Worcester to the
East right to the water.

To subscribe to the list, send a message like this:
To: scan-mass-east-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-mass-east-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests currently go out about every two days.

The eaiser way to do it!

If you have direct WWW access, you can get on (or off) of the
list via the simple interface at:
http://www.netspace.org/cgi-bin/lwgate/scan-mass-east/
or:
http://www.netspace.org/cgi-bin/lwgate/scan-mass-east-digest/
depending on which list you're interested in.

Tell your friends and spread the word!

From: michael@alexander.terranet.com
Message-ID: <michael-2402961141560001@alexander.terranet.com>
Source record: 239248

Thanks to the many people who have written to me in the past 7-10 days with info about the prices they paid or received for their used scanners. I updated the price guide, which resides at www.ultranet.com/~bellvill/scanner.html, today and sent it to Rob. I'm sure he'll post it in a day or two.

The guide continues to evolve; if you have any info to contribute, please send it to me. I haven't had time to check on all of the list prices for the scanners in the guide, for example. If you can plug some of those numbers in, please drop me a note for the next update. I'm trying to gather actual paying/selling prices (not asking prices) for mint condition scanners only. Mint condition in this case means a scanner that would appear to have been driven by a little old lady only on Sundays--just about perfect, in other words--complete with original box, manual and accessories.

Also, I'd appreciate your taking a look at the computer-aided FAQ at the same site and giving me feedback. There's still a lot of work to be done on that too, but I just don't have a lot of time to devote to it right now. What questions are missing? What about the accuracy of the information? Do you have first-hand experience with a particular scanning software package and are willing to right up a mini review for the FAQ? Let me know.

>So...why don't they design the phone to call another without needing to
go
>through the network. Therefore bypassing any toll charges.I'll tell you
>why because it is a scam

Also, because 1) The "other" phone could not be a normal home phone or
office phone, ect.
2) The "other" cellphone would have to be in, what,
a range
of 3 miles to actually get good reception, where
at this
point, you could just by a cb for $60...

HOWEVER, I SAW a guy with a scanner/cellphone looking thing and asked him about it. He said it was basically a network with people using things much like ham radios with CTCCS(or whatever it's called) You could "dial" the number of another person using the free service, and then use repeaters to talk to only them(other sets don't get it). Unfortunatly, he said these cost around $900...

I know that during WWII, ham radio operators used to send their signal
along the 60 Hz power line. I can do this in the lab with a op-amp
summing circuit, but it won't work for high power lines. I was also
told you could have your signal sent though multiple series capacitors
and connect directly onto the line. Can someone help me or at least
point me in the right direction...

> Tucker's used to carry this book that covers both the AR-1000 and the
> AR-2800 and I guess I made a mistake in not ordering it when it was
> available from them.

The AR1000, TR-1200, Camnis HSC-010 and Fairmate HP-100/200 etc models
were all the same so Howards book would be applicable to all of them.

The AR2800 and AR1500 were similar and certainly his guide could be used
an an excellent refernce although they did have the extra feature of SSB
reception by the manual BFO. The AR2800 having both "fine" and "rough"
BFO tuning. As you suggest though the "basics" of these two are the same
as the AR1000.

Good luck.

> Thanks!!!

I have a pro-51. I scan the local Fire/Rescue channels,but I don't use
the built in FIRE band scan. I have all the freqs programmed in (I know
them since i'm a member of Fire/Rescue services). I have all the local
stuff programmed into a bank and a half (30 channels). Other county's
stuff I have on a different bank. And I have police on a seperate bank.
It's nice to have different locales in different banks because sometimes I
only want to listen to what's going on locally.

4370. FS: Yupiteru MVT 8000 (price reduced)

Newsgroup: rec.radio.scanner
Date: 1996-02-24 00:00:00 UTC
From: lmilrad@passport.ca
Message-ID: <4gnrjh$iao@diplomatic.passport.ca>
Source record: 239260
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Price is now $450.00 US plus shipping.

The MVT 8000 is 200 channel ac/dc scanner with a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired.

It covers 8 Mhz to 1300 Mhz (continuous without blockage) and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz.

It's got a 10 band search function, pass memory function, and other goodies found in high-end
scanners.

4378. _Pro-26 Mods/Specs_

Newsgroup: rec.radio.scanner
Date: 1996-02-24 00:00:00 UTC
From: ron.roth@canrem.com
Message-ID: <60.31915.5773.0N20BE58@canrem.com>
Source record: 239268

For those who sent for 800 MHz and back-light mods, and whose mail I received before the 21st of Feb, I have sent out a second package with an additional mod that extends the battery life another 2-3 hours. For those whose mail I received after the 21st, the package will automatically include all four mods.

I found that when using rechargeable batteries with the Pro-26, the warning beep and BATT Lo indicator appear when the voltage drops to about 4.75V, and at 4.55V the scanner cuts out prematurely, even though there is lots of battery power left.
By removing R515 on the logic board, one will not get that annoying beep any longer (neither will the BATT Lo indicator appear), and the scanner will continue to operate for an additional 2-3 hours before cutting out. As the Pro-26 approaches about 4V, its sensitivity and voice clarity starts to decline, at which time one can recharge the unit, or continue to listen at lower volume levels until the scanner cuts out.
If someone *does* prefer the warning beep and BATT Lo indicator, but likes the extra hours of listening, then replacing R515 with a higher value of around 27k Ohms will still prevent the scanner from cutting out prematurely, while the beep and BATT LO indicator kick in later at a lower voltage level of around 4.3 Volts.
Since there are surface-mount components involved, this procedure though requires better than casual soldering skills.

How fast the batteries discharge depends of course on the listening volume, whether the back-light is being used, and on the frequencies programmed in. Here is a list of (approximate) squelched current levels at 5V for various (approximate) frequency ranges:

0 MHz ..... 80mA 311-375 MHz 108-110mA
25-29 MHz ..... 85mA 376-399 MHz 113-114mA
29-107 MHz ..... 78-80mA 400-511 MHz 107mA
108-136 MHz ..... 83-84mA 512-805 MHz 80-81mA
137-224 MHz ..... 77-79mA 806-900 MHz 104mA
225-249 MHz ..... 82mA 900-1011 MHz 102-104mA
250-310 MHz ..... 86mA 1012-1300 MHz 104-107mA

Hello,
I want to control my AOR AR8000 scanner from my pc.

I have an interface to convert the RS-232 to TTL, but I need to know what the commands are.

The AR8000 manual says that more information comes with their own interface, so consequently there is no mention of the command in the main manual.

Any help will be greatly appreciated.

Thanks. Paul (paul@kfvr.demon.co.uk)

Hmmmm....this sounds discouraging. I have a Uniden EXP9200 2-line phone.
I bought it because of the 'spread-spectrum' and digital features. I don't
like the idea of people like me listening to me! :)

I have put a frequency counter up to the base and handset with unstable
results. It reports anywhere from 500Mhz - 800Mhz with about a 50% of normal
signal strength. I am assuming that this is because it is transmitting on
multiple frequencies at the same time and it just 'confuses' the frequency
counter.

I have also scanned the ~902Mhz - ? as indicated in the manual with no audible
results.

I will be checking out the 400+Mhz range over the weekend and let you know how
I make out......I would be interested to see what results you come up with as
well.

Mike

> Elevation: 300'

I would have to second the motion for the Aircraft Enroute Service between 128Mhz - 132Mhz. I have heard things from "smoke in the cockpit" to "we need a new stewardess".

I hate listening to fastfood but, I like the thrill of trying to find them while I eat my lunch. They are anywhere from 25Mhz to 900Mhz. They are a challenge because some signals are very weak.

I also like to listen to the USFS and CDF(California Dept. of Forestry) during the summer when they are fighting fires. They are in the 122 area for bombers, and mainly in the 150's and 160's for the crews. With some 450 stuff I think.

Lastly, Just for kicks I like to use a satellite tracking program and try to pick-up the Mir at 145.550 and 145.850 and NOAA weather sats at 137.620 and 137.500. You can also pick more sats up at 150.000 and in the 149Mhz area. I just don't know what they are yet.

I hope this helps you in someway

Radio Shack PRO-43 Modifications FAQ
< Last modified September 10, 1995 >

CONTENTS

1. Introduction
2. Which units can be modified for extended frequency
reception?
3. Companies that will modify the PRO-43 for extended
frequency reception
4. The modifications
extended receive (original mod + solderless)
keypad beep delete
improved audio
attaching an S-meter
400 memory channels

---

1. Introduction

As long as there is a continuing demand for it, this mini-FAQ about PRO-43 modifications will be posted every month or so. In large part, it is the file PRO43.MOD from pub/hamradio/mods/tandy at oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter

There is also a mod for 400 memory channels, but, to quote its author, it is very complicated, should only be attempted by someone with moderate to advanced electronics experience, and is not for the faint of heart or the "weekend technician." A brief description is included at the end of this FAQ. If the mod were included in its entirety, the size of the FAQ would be increased four-fold.

---

2. Which units can be modified for extended frequency reception?

Note: In the United States, it is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment that can receive or can be modified to receive such communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive? Units sold in the US and Canada can be identified by the following scheme

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994). There have been *no* reports of a modifiable US 3A4 unit. However, there have been reports of a modifiable Canadian 10A4 unit; it did not have an A in the serial number. Until there is evidence to the contrary, the following rule for determining modifiability of a PRO-43 is to be considered *definitive*.

THE SERIAL NUMBER IS THE MOST ACCURATE WAY OF DETERMINING WHETHER A PRO-43 CAN BE MODIFIED FOR EXTENDED FREQUENCY RECEPTION. IF THE SERIAL NUMBER CONTAINS AN A, THE UNIT IS NOT MODIFIABLE.

It has been reported that some units currently being made for sale overseas can be modified for extended 800 MHz reception. However, it is not known whether this applies to all overseas units or, if not, whether there is a way to distinguish modifiable units from nonmodifiable units.

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a changeover or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the extended receive modification is worthwhile. According to Bob Parnass, from his "Improved Audio Mod", below:

"Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it. On the other hand, quoting ray_reese@tscnet.eskimo.com (Ray Reese),

When I purchased my PRO-43 and did the mod for adding 54-88 Mhz, using the removed cell. diode, I wanted to be able to listen to the sound carrier for the tv channels 2-6 as well as the 72-76 Mhz band. It is worth the trouble to make the mode and it does work well in my area, despite not having the correct coils for that band area. Do the mod anyway, but [if you've trashed your original diode], use a 1N4148 fast-switching diode. Perhaps a 1N914 might do the job also. They can be found at Radio Shack for a cheap price.

---

3. Companies that will modify the PRO-43 for extended frequency reception

If you'd rather not do the modification for extended frequency reception yourself, Cellular Security Group, 106 Western Avenue, Essex, MA 01929 (508/768-7486) will do it for $40, which includes insured UPS return postage. However, CSG will not move the diode to extend the low band to 88 MHz; they only remove the diode to unlock the 800 MHz frequencies. When CSG is mentioned on the net, two types of comments follow: testimonials from satisfied customers and comments from those with the technical skills claiming that the service seems high priced for just removing the diode. But, there have been *no*

reports of shoddy work or damaged radios. (They've modified
two of mine.) Units are processed within 24 hours of receipt.

Grove Enterprises' newly advertised Repair Service will
perform the mod for $40 plus shipping. They will move (rather
than just remove) the diode in units that can benefit from it,
but state that there is no way to tell whether the diode
should be moved without looking inside. They claim that the
determination can not be made from the serial number, FCC-ID,
or date of manufacture. For further details, call Grove at
704/837-7081. In order to get a unit modified, a service
order number must be obtained from the same telephone number.
Packages without a SO# will be refused.
---
4. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out
you should not remove but MOVE the diode. Doing so allows cellular coverage as
well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them.
They are selling the PRO-43 for $300 which is $50 less than Radio Shack.
I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone
conversations.

The following procedure requires familiarity with microcircuit soldering and
will violate your warranty. Grove Enterprises assumes no liability resulting
from its attempt, nor will accept the modified scanner for return under any
condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a
desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips
screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully
unsolder the two antenna connections from the board. Bend the antenna ground
tab fully up from the board. Carefully lift the board, unplugging the black
connector at its base, and lay the board out of the way on its bundle of
colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging
the white connector at the bottom of the board. Lift it up and lay it aside on
its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

From: IN%"savage@dg-rtp.dg.com" 2-FEB-1995 17:55:07.31

BTW, I did something similar [to the mod that follows] but MUCH easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the batteries usually lie. You'll see the diodes there. Simply take an xacto knife and and break the solder on the D4 diode (left-most on mine) on the side facing you. I just cut back-and-forth for a bit. Once the solder (it's surface mounted) is weak enough, I just bend up the diode a bit from the PCB. Presto. I left mine hanging on the one side with solder. If you continue to work it a bit, you can probably remove the whole diode.

--Ed

From: springel@umich.edu (Jason G. Springel)
Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading many of the praises for the Pro-43 on this newsgroup. I decided to try and MOD it, but don't have a lot of experience with a soldering iron. After examining the scanner's innards, I found it was quite easy to "fix" with nothing more than a minature philips screwdriver and some small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit), remove the two screws from the lower circuit board. Looking down at the unit, you will see that the screw on right side of the lower circuit board can be easily removed. Remove the screw on the left side by by sliding the screwdriver between the top circuit board and the metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel (antenna, volume, and squelch knobs) along with the top two circuit boards as one unit. The two circuit boards will be connected to the final circuit board (the one attached to the front section of the scanner) by several wires. Simply set the top panel/circuit boards alongside the front section of the scanner and you can leave these wires connected.

Step 5

The microporcessor is located under the large metal shield on the final board (the front section of the scanner with the display and keypad). If you look under metal shield from the side closest to the bottom of the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to remove it completely (unless you want to use it to restore additional frequencies as explained in other MODs), you can just lift one side so it dosen't make connection and then put a small piece of tape or heat shrink over it, so it won't. Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are
filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I
do not know. My thanks go out to the original author of that MOD!
Hope this helps those of you who do not own a soldering iron!

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend
antenna ground lead up out of the way). Be careful of black connector at
bottom of board. Flip board over and lay aside (wire connectors need not be
disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two
multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one
end of connector has pin 10 labeled as such. Count back to pin 6 and bend
pin 6 ninety degrees towards the large RF shield. Make sure the bent pin
clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The
lack of treble makes it difficult to hear the PRO-43 in
noisy situations, especially while listening in a car
or truck. Louis Shirley sent me a schematic and sug-
gested I remove C341, a tiny 0.015 ufd surface mount
capacitor.

I'm glad to report that removing C341 made a great
improvement. The audio is now much "crisper," more
like the Uniden 200xlt, although still not quite as
loud. Turning the volume control up still overloads

the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

---

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

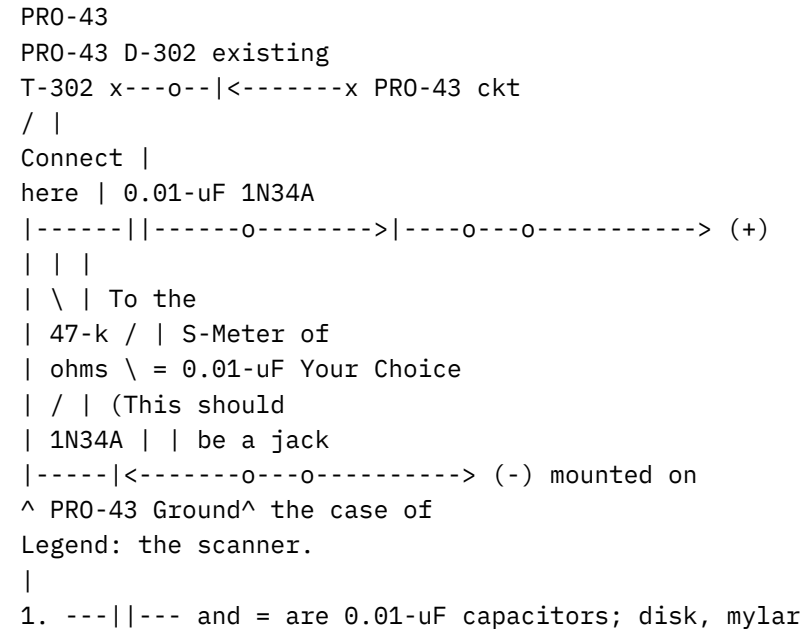
Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

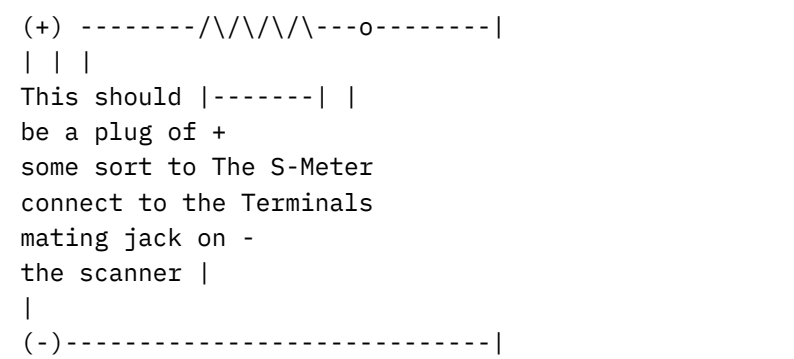
The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



PRO-43
PRO-43 D-302 existing
T-302 x---o--|<-------x PRO-43 ckt
/ |
Connect |
here | 0.01-uF 1N34A
|------||------o-------->|----o---o-----------> (+)
| | |
| \ | To the
| 47-k / | S-Meter of
| ohms \ = 0.01-uF Your Choice
| / | (This should
| 1N34A | | be a jack
|-----|<-------o---o----------> (-) mounted on
^ PRO-43 Ground^ the case of
Legend: the scanner.
|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|
2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode
3. o means a connection, preferably soldered
4. The 47-k resistor is self-explanatory, I hope.
5. -------- and | are wires/conductors.
|
|
6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:



You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

From: bbb@kuhub.cc.ukans.edu (LORD BB)
Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my

own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

UPDATE On my previous query.....

The 800 mhz trunk system in our area that recently added a 1230 Hz
tone is a Motorola System. I am not exactly familiar with the
model of the system, but it definately is not full digital and most
radio traffic is analog. Still wondering how we can get around
this aggravation.

I apologize I hit the wrong button when I sent that piece of flame about Radio Shack. I meant to post it to the news group. It was not meant to go to you personally.
I try not to send anyone out of the store with anything they dont need. When it comes to people that come in the store needing electronic parts, I let them get what they need. If they ask me where a part is I try to know enough to be able to go get it for them and save them time. But when someone comes in and ask me if they can use this part with this value and that part with that value and make it do this? I say, I'm not the technician, I'm A salesman. I can sell you the parts you need to build somthing but that doesnt mean I can can tell you how to build it.

Anyway if you would care to forward that piece to the newsgroup I would appriciate it.

As far as your computer goes Radio Shack doesnt take trade ins

Guess your right. It does have some sort of logic. I hope no one takes my digs at the shack in any personal way. It's still the best place to grab those hard to find electro-bits and pieces.. Great entry-level employment as well. Still think though, if you wanted answers *AND* a burger, you have only one choice!!

Since I am so far off topic so far, let me ask a question about my new Bearcat BC3000XLT.

Could some one drop a note about where I could get a spare battery and case for it? (I am not going to any burger joints tonight)!

4407. Re: PROGRAMMING CELL PHONES

Newsgroup: rec.radio.scanner
Date: 1996-02-24 00:00:00 UTC
From: clifto@indep1.chi.il.us
Message-ID: <Dn9pyt.2xK@indep1.chi.il.us>
Source record: 239328

In article <312D35A2.7409@why.net> Bernie Pineda <bpineda@why.net> writes:
>So...why don't they design the phone to call another without needing to go
>through the network. Therefore bypassing any toll charges.I'll tell you
>why because it is a scam. By forcing you into the network they are able to
>charge you. Also cloning a phone if you use the trunking system analogy
>means that you can have many means of accessing the service that you
>paid for! Good luck on your crusade.

sigh Another Giant Conspiracy To Charge Toll Charges.

If one phone called another directly, the call would have to go through
every repeater everywhere in the calling area, or cell sites would have
to have highly sophisticated and extremely expensive tracking and
routing circuitry to locate both vehicles and route the call through
only the repeaters in their path. You could then have about 300 phone
calls going at once in the entire area served by cellular telephone.

If the phone call goes from phone through one cell site to network, the
system can handle about 300 calls per CELL, the cell doesn't need to
know where you are or where you're going (it can just say "I can't
hear him, all y'all other cells, someone else get his call"), and
the whole thing is more foolproof, less noisy and MUCH cheaper for
all concerned.

Subject: Icom R-7000 repair help!
Newsgroups: rec.radio.amateur.misc
Summary:
Keywords:

I have an Icom R-7000 receiver which has freaked out. Turn it on, and the display goes nuts. It has a mind of its own, blinking and switching bands and modes. Quite a sight to see, but not very functional.

My first thougth was that my recent replacement of the memory backup battery broke something, but I seem to recall that the DC-DC board had some sort of design problem with an underrated capacitor. I can't find a reference to the exact fix in my files; does anyone have a copy of the relevant info?

Thanks!

Greg KO6TH

Message-ID: <4gmv85$gkg@news1.usa.pipeline.com>
Source record: 239335

I have a request. I would like to receive the frequencies for the
following agencies in the San Francisco Bay Area:

1)Oakland Police
2)Oakland Fire
3)San Jose Police
4)San Jose Fire
5)Milpitas Police
6)Milpitas Fire

I would also like to receive the 9,10, & 11 codes used by each agency.

I would prefer to have this information emailed to me.

With thanks,
Chris Halladay (trekker1@usa.pipeline.com)
Castro Valley,CA

Message-ID: <4gmnd5$ped@newsbf02.news.aol.com>
Source record: 239336

Someone e-mailed these codes to me and I thought I'd pass them along. By holding down the appropriat button while powering up the unit, you will get the below listed effect on the 3000xlt scanner.

Here are the Buttons to press while turning the Scanner on
along with my notes:
DLY: changes the rescan delay to 4 or 2 Sec.
AUTO: disables the sorting of Freqs. within each
bank while scanning, but slows scan rate.
(MY note-- If you do any 800mhz trunked scanning, press so
that "OFF SORT" shows. It makes listening to these systems
easier, and the scan rate is not affected much!!)
E(nter) key: disables keypad beep.
2, 9, Manual: resets scanner and zeroes all channels.
(MY note--don't mess with!!)
2,9,Lockout: tests all display segments.
(MY note--good if you want to make sure everything works!!)
2,9, Scan: loads test Freqs. into channels 1-14 and 21-30.
(My note--another not to mess with!!)
2,9, DLY: turns off delay for all channels
2, 9, Key Lock: displays "EEECH" then "USA 0.09"
(MY note--mine shows 2.0 instead of 0.09, my idea is that
this shows the firmware version. What does yours show???)
That's it!! Let me know if you have any questions.

Hello,
I have an ICOM R7000 receiver for sale..1 year old...25 MEG to 2 GIG..
I am asking 1200 dollars or best offer. Please list it in your local
swap nets if not iterestead in it yourself. I dont have any transmitter
gear and cant get any because I live in a dorm at Kirtland AFB, New
Mexico. I can be reached at 505-853-2157(work) has 24 hour voice mail
so leave a message. You can also E-mail me.
I am selling it because I need the money to pay off a computer
purchase.

Newsgroup: rec.radio.scanner
Date: 1996-02-25 00:00:00 UTC
From: pdrunen@aol.com
Message-ID: <4grd78$d8l@newsbf02.news.aol.com>
Source record: 239140

Special thanks to everyone that asked for a copy of my DTMF program. I have made the DTMF program available at my ftp site. You can still request it by e-mailing me at PDRUNEN@AOL.COM.

To get there ftp to users.aol.com

login as "ftp"
Password as "your e-mail address"
then cd /pdrunen
then cd /dtmf
get dtmf_v11.exe.

You will also find a really nice windows based GIF viewer, VUGRAF13.ZIP for the taking.

4423. _Pro-26 Mods/Specs_

Newsgroup: rec.radio.scanner
Date: 1996-02-25 00:00:00 UTC
From: ron.roth@ghbbs.com
Message-ID: <8BB6503.0AA30016CE.uuout@ghbbs.com>
Source record: 239144

For those who sent for 800 MHz and back-light mods, and whose mail I received before the 21st of Feb, I have sent out a second package with an additional mod that extends the battery life another 2-3 hours. For those whose mail I received after the 21st, the package will automatically include all four mods.

I found that when using rechargeable batteries with the Pro-26, the warning beep and BATT Lo indicator appear when the voltage drops to about 4.75V, and at 4.55V the scanner cuts out prematurely, even though there is lots of battery power left.
By removing R515 on the logic board, one will not get that annoying beep any longer (neither will the BATT Lo indicator appear), and the scanner will continue to operate for an additional 2-3 hours before cutting out. As the Pro-26 approaches about 4V, its sensitivity and voice clarity starts to decline, at which time one can recharge the unit, or continue to listen at lower volume levels until the scanner cuts out.
If someone *does* prefer the warning beep and BATT Lo indicator, but likes the extra hours of listening, then replacing R515 with a higher value of around 27k Ohms will still prevent the scanner from cutting out prematurely, while the beep and BATT LO indicator kick in later at a lower voltage level of around 4.3 Volts.
Since there are surface-mount components involved, this procedure though requires better than casual soldering skills.

How fast the batteries discharge depends of course on the listening volume, whether the back-light is being used, and on the frequencies programmed in. Here is a list of (approximate) squelched current levels at 5V for various (approximate) frequency ranges:

```
0 MHz ............. 80mA 311-375 MHz ....... 108-110mA
25-29 MHz ............. 85mA 376-399 MHz ....... 113-114mA
29-107 MHz .......... 78-80mA 400-511 MHz ........... 107mA
108-136 MHz .......... 83-84mA 512-805 MHz ......... 80-81mA
137-224 MHz .......... 77-79mA 806-900 MHz ........... 104mA
225-249 MHz ............. 82mA 900-1011 MHz ....... 102-104mA
250-310 MHz ............. 86mA 1012-1300 MHz ....... 104-107mA
```

In article <sourceDMzn6J.8CH@netcom.com>, source@netcom.com says...

>The remark in question was,
> "drugged drivers cause as many accidents if not more than drunk
>drivers."

Whoops! How the hell did I miss that??? Since that post has expired on my server all I can do is take your word that that's what the original statement was.

>The evidence cited to support this claim was partial mention (i.e. no
exact
>Who What When Where Why) of four (4) incidents, and NO references to
any
>specific sources of the info. Assuming that this is the best you can
do,
>you have DISproved your thesis, since there are lots more than four
>accidents caused by drunks over the same time span.

I was the source...I covered those stories myself...but like I said...if this was the statement posted (I can only take you word for it now) I agree it would be incorrect on my part to say that drugged driving killed *MORE* people then drunk driving. I know that is not so!

The original point I was *TRYING* to make was that drugged drivers kill more people then some folks think *AND* there has been a marked increase in arrest and deaths of those types.

I stand corrected!

I bought one, but I find it lacks sensitivity. It just shows random
values unless you connect it directly to a signal source (like RS's
micro-power "transmitter", for example). To use it to measure the
frequency of a nearby transmitter (police, fd, whatever) I'm sure I'll
need a preamplifier.

Does yours work better than this?

Most of them are now in the 'new' extended AM band (1630-1710 KHz), so
it would be fairly easy to pick those up.

But, its been a LONG time since they made them in that range. Over 10
years ago. Most of them have gone to the demsty dumpster since then :)

ANYTHING of that frequency range with very short wavelengths (i.e.
high frequency) can cause cancer if strong enough and close enough to
the body.

this includes cellular phones (the hand held ones) only if you use
them a lot (though I doubt it for the occasional user)

>Is it possible to change the "cap code" of a Motorola type numeric pager?
>If so, how?

>Regards,

>KH

Yes, it is possible. The paging company we use at work loaned us the equipment and software to remove the capcodes for the news updates on the pagers we issue to drivers. It is a very simple and painless procedure if you have access to the equipment. I was surprised at all of the programmable choices available on the alpha numeric pagers. You just drop the pager into the holder, scan its memory into the PC and then make the changes you need to. The software then writes these changes into the pager. I was able to change/delete capcodes, change the message that appears on turning on from the leasing companies name to our company name and phone number, change if messages are deleted or kept when unit is turned off and several other things. This took just a copule of minutes per pager and I had no previous exposure to any of this and no instruction in using the equipment. It had been hooked up to the PC while I was out making a delivery.

Very simple process if you have the equipment/software.

4434. Re: Why monitor Fast Food joints?

Newsgroup: rec.radio.scanner
Date: 1996-02-25 00:00:00 UTC
From: Ed Walsh <emw@adnc.com>
Message-ID: <3130821D.1401@adnc.com>
Source record: 239199

> Why would anyone want to monitor fast food joint frequencies?

I enjoy monitoirng the freq's mainly because of the conversations between the employees. They will often talk about their dates, what customers look like and such. About a year ago I went to a McD's that had a double drive-thru window. I paid at the first window and then heard the girl say "Jenny, watch out, the guy in the Taurus is in a really bad mood". So, when I got to the pick-up window I really turned on the charm and was in a GREAT mood. I drove off and heard Jenny tell the other that I was great to her and that she must have caused my bad mood towards her.

Anyone else have funny stories of monitoring fast food?

>Anyone else have funny stories of monitoring fast food?

Mount a PA speaker behind the front grille of your car. Then, wire the PA speker to the external speaker jack on the scanner. Punch up the drive-thru's frequency and get in line. People in front of you will freak out as they hear themselves...and the restaurant employee's voice coming from BEHIND them! When you get to the window, turn it up as you speak and there will be massive feedback! Turn it down as they talk and then back up again when you talk...they think there's something wrong with their headset and usually go get the manager!

Good, cheap entertainment!

>the guy at Radio Shack told me it wouldn't work. Any ideas?

The first rule is "never believe anything that Sammy Salesdroid from Radio Shack tells you." Usually, just the opposite is true.

>First a TV antenna is horizontal, most scanners uses use vertical
>polariation.

Drill two new holes in the boom and mount it vertically! Since TV antennas are designed for a wide variety of frequencies from 50-900Mhz, it will work very well as a scanner antenna. Remember, though, that the antenna is directional and will have to be aimed accordingly. Also remember to feed it with RG-6 (satellite) coax. NOT RG58 or RG59.

4443. CB is CB (was: No Code = No Brain = CB)

Newsgroup: rec.radio.scanner
Date: 1996-02-25 00:00:00 UTC
From: norelco@shadow.net
Message-ID: <norelco-2502961314040001@ppp-ftl1-47.shadow.net>
Source record: 239208

While there are countless obnoxious idiots playing with CB, it may be here to stay. It has it's purpose, as well as many limitations.

I have one and use it "on the road" on long trips. It can be entertaining and helpful. It can also be frustrating when lots of "wanna-be's" are all trying to do what they think is fun, important, or just act like a--holes. Truckers can provide helpful info, and there are a few jerks among them too. It's like walking down a street - you meet all types. There are a few CB'rs who do have a life, and don't devote it to the CB, like me. I probably turn mine on 2-3 times a year on the open highway. When I was 12, I wanted to play with it all the time.

In comparison, there are some "scanner nuts" who might sit for 4-5 hours at a time listening to the scanner. They might know how many traffic citations were issued in an afternoon, but fail to realize that things are happening in the real world, country, state, etc. (Or even in their own home.)

Licensed radio operators also come in different types. Some have elite attitudes: they think that because they "got their ticket", they are better than CB'ers. Some realize that there are a few real humans who might be on a CB for road informaton, and some of them are Ham operators - some are not.

I think more time ought to be spent on positive things and helping others and sharing information than knocking the underdog. I'm just tired of seeing a topic knocking CB day after day after day. Maybe now, after I spewed all this garbage (forgive me), the topic that ought to be dead will die.

That's just my 2 cents worth...

And I will not end this with "73's".....

I have been thinking about buying a scanner for w hile and I just found the Pro-2037 on sale for $249.95 CDN (reg. 399.99CDN) at my local Rat Shack. I would like to know what people here think of this scanner and also if there are any MODs (cellualr, perhaps?). Also, cuold someone please tell me exactly what the difference between a base and a mobile scanner is? Is there some reason a base scanner can't be used in, say, a car or is it just the size factor?

I don't suppose the sale will last long so any quick responses would be greatly appreciated. It seems like a great deal.

Thanks for your help.

I myself always tune in to the airport, police, fire, and medical. I
sometimes tune in the local traffic reports and tv stations. My scanner
has 100 channels split into 10 channel blocks, so I usually keep the
police in one block, fire in another, and so on.

>
> Does yours work better than this?

You say it lacks sensitivity, are you comparing this to another frequency
counter? I find mine is fine. Of course you need to be RIGHT beside things
such as cordless phones, etc. because these are LOW power. WHen you think
of the thousands of radio waves that are bombarding your counter, it needs
the strongest signal possible.

As wierd as people may think, I like listening to the T.V "cue"
broadcast,
where you can hear the studio talking to the remotes and such.

Also, the FBI and Secret Service is fun. If you do not live in a huge
metropolitan area such as LA/Orange county, It most likely would be
reeeaallly slow!

As far as "channel management", I sort like items by banks. CHP in
the first two banks, Orange County Sheriff/Police in another, Fire in
one and so on. I leave bank #10 open for temporary stuff, like the
police
in a city I do not visit often. Or the repeater that carries the Space
Shuttle
while it is up and about.

If your Pro-43 is able to be modified for cellular you should go for it!
Lots of wild trash that is entertaining when all else fails!!
(Of course being illegal, I have not actually participated in that
activity.
Just heresay!!!)

SUBJECT: Re: WHY CELLULAR?
I have said the same thing about people who watch "soap's"
on TV!! At least the trash I hear on cellular (or should I say "have
heard
about ") is real life! Nothing like that late night phone call from
a overdue husband trying to explain where he is!!

Or as is done in The LA/Orange county areas [and many others]]
the police often use cellular to talk about stuff they want to keep
"private"!!

I often hear both sides and if you scan up or down you can often follow
callers from cell to cell.

And last, when you pick up someone calling a 1-900 slut line,
that saves 5 bucks a minute!!!

Anyway why does anyone listen to anything?? It is just human nature
to be curious!!

CQ Magazine has an ad for a Stand Alone unit that will pick up
ACARS. AEA is the company and they have the AEA ACARS which comes with
Demodulator & Software. Not price listed but should be much cheaper than
the Universal M-400 unit.

Hey ALL - For anyone searching for mods on thier scanners etc. look no further than the Oakland FTP site...

oak.oakland.edu/pub/ham_radio/mods/

This place has several directories from which you can find mods for most any scanner/radio...remember that any scanner 'manufactured' after April 1994 is designed to not be easily modifiable if at all.

Johnny

FINANCIAL INDEPENDENCE IN 3 WEEKS STARTING FROM ZERO!

This is NOT a pyramid or letter write scam!!

Secrets and Legal Tricks to Get Rich Overnight!

This is the largest collection of money maneuvering secrets and legal tricks ever assembled. Step-by-step from literally nothing to financial independence in the shortest time. Revealed are secrets known only by top financial consultants.

An Opportunity and a Promise....
If you are presently in debt or have poor credit rating or in constant need of money or desire to go into business with no money to invest or need funds for expansion or ï¿½just for the thrill of suddenly having money and being wealthy!ï¿½ The money is there and I can tell you WHERE IT IS! I reveal the secrets of HOW TO GET IT, and become INDEPENDENTLY WEALTHY in the shortest time - within weeks! If you are in disbelief over the kind of money that can be yours and that it is actually possible... consider that thousands of people are doing it right now!

Money For Free! Itï¿½s No Fantasy...
Something for nothing? Believe it or not, thousands of people actually GET MONEY FOR NOTHING! Where is this free money coming from? In 1992 there were 28,821 individuals and organizations who gave away money FREE, and the figure grows yearly. I repeat: They gave away (not loaned - GAVE - like in FREE).

Raise $2,000 to $50,000 Overnight...
For personal use or starting a small business. You are shown how to do it immediately, and how others, no better or smarter than you have done it.

Wipe Out Your Debts Permanently...
NO bankruptcy is involved, NO gimmicks, NO tricks. Itï¿½s so simple, and it DEFINITELY WORKS!

Establish Excellent Credit Rating...
The most elaborate summary of the credit systemï¿½s guarded secrets revealed. WHAT YOU CAN DO WITH THIS INFORMATION IS MIND-BOGGLING! How you can easily repair or fix a poor credit rating, with simple letters and step-by-step instructions showing you how to do it easily and without cost.

All The Money You Need From Your Credit Cards Quickly...
Clever, little known tricks you can do with your credit cards. Some may be considered a little underhanded, yet they are perfectly legal! They are done regularly and YOU CAN DO IT just as easily!

Borrow $2,000 to $25,000 in 24 Hours Without A Credit Check...
NO credit check, and often you DONï¿½T even have to reveal the purpose. For business use, even higher amounts, also without a credit check.

Appear To Be A Millionaire In Just A Few Weeks...
Creating an image of wealth is all it takes to open a world of opportunities that would otherwise be unavailable. Live in a $250,000 house, beautifully furnished, rent and expenses paid. Drive a new car, free and clear. I am not kidding, itï¿½s for real. Many people do it -- Itï¿½s all in knowing how.

The regular price of my collection of books is $39.99, but for a short time internet customers will receive my complete collection of Money & Credit Secrets for only $24.99! And all this comes with a full 30 day money back guarantee if not delighted! If you would like ordering information please Email me and Iï¿½ll tell you how to order..

Thank you for taking the time to read this information.

>bikes, canoes, hang-gliders, etc etc, just about anything that
>races against anything else. Thanks.

If your talking JUST about the cameras and not the RF transmission
systems well....

We call them "lipstick" or "cigar" cameras...they are very small and
resemble cigars or lipstick cases in size. They are mounted on
roofs,bumpers etc. I mounted one on the fuselage of a "Formula V" racing
plane last year at the U.S international Airshow in Dayton Ohio last
year. A cable runs from the camera to a "CCU"(Camera Control Unit) which
provides the power and color control...from there the cable ran to a
sony "palmcorder" for taping. This camera was fix mounted. On racecars
and boats these cameras can be mounted on a radio controled "pan-tilt"
heads that are controled by the company that provides the incar/boat
coverage. The networks (in the US) don't install these systems...private
contractors do. Most exterior fixed mounted cameras are housed in in an
element proof enclosure that uses a rool of clear film that advances
every few seconds to keep the shot free of roadgrime or water drops.

These systems weigh only a few pounds with all the batteries,RF
electronics and camera/tilt heads.,they have too be light or racers
would'nt give the ok to use them in thier cars. RF antennas are
"pancake"type so there is no wind resistance and helos are often used to
"hop" the signals back to the control truck,notice that you hardly ever
see an in-car shot while it's going thru a tunnel???

OK,OK...it's a little off topic...forgive me.

> point me in the right direction...

It works quite well, the military, intelligence community, and other
assorted spooks still transmit RF over the AC line, CATV, and Phone
wiring.

It is possible to maintain a low power signal on the AC mains up to around
50-54 mhz, once the freq gets up to around 200-250mhz the loss to too high
to be of any value.

BTW: Most AC mains RF systems operate on freqs below 500khz

The math I use and have been told by all the hams around here is 468 devided by the freq you are cutting it for ie: 468 div. by 161. mhz=2.9 ft. This formula has always worked for me.

73 good luck

Well I work at Radio Shack also and you can use it for a scanner antenna. that
is just his job to sell you a scanner antenna. By the way, use 50 ohm coax
which im sure you already know. Also a tv antenna wont be near as efficient as
a good scanner antenna but it will work.

4486. What are the BC2500 Tricks???

Newsgroup: rec.radio.scanner
Date: 1996-02-25 00:00:00 UTC
From: schner@c-zone.net
Message-ID: <4gp6cr$s5n@tweety.sna.com>
Source record: 239288

What are the keypress tricks for the Bearcat BC2500 and what do they do? Are any of them very usefull like the light toggle trick on the BC3000?

Anyone have a spare service manual they want to give away? I can't see spending $25 + shipping for something I think they should have included.

Please e-mail

Thanks in Advance,

Jim Schneringer
Shasta Lake, CA.

>How does someone identify a control channel in a trunked system?

You'll hear data on it. Buzzing sounds. On older Moto systems it changes once in a while. It should be one of four system channels. Either the highest or the lowest four - I can't remember right now.

Greg,

Change all the electrolitic capacitors on the DC-DC convertor PCB, and while you're at it do the same on the display board. I have 2 R-7000's under my "control" between work and home and they've both needed the caps changed.

Julian,

The 2037 has *so far* not shown up on any "easily restorable" lists to cover cellular. It's a newer model that's similar to a Bearcat model. Not fancy or particularly wonderful as scanners go. The GRE made PRO-2006 (now discontinued but around in some stores) and the 2035/2042 U.S. models are superior, albiet more expensive.

There's no real difference between a base and mobile scanner *except* the base-only models don't usually have a 12VDC input for automobile use. They're generally only powered by 120VAC. A handheld on the other hand, with a suitable external speaker and AC & DC adapters, can suit all purposes very well if you can live with small keys and even smaller displays!

> What does "unblocked" mean?

In the U.S., it's illegal to listen to telephone conversations. In their infinite wisdom, the government has decreed that it is also illegal to sell scanners capable of receiving the cellular band. Don't ask me why the conventional portable phone bands are still legal, but as far as I know they are.

An unblocked scanner is one that can receive the cellular band. Most of them are easily modified so that the manufacturer doesn't have to produce a different model for foreign use.

If I remember rightly, it's also illegal to sell scanners that can receive the cellular band accidentally by overloading the front-end. Or at least Radio Shack seemed to think so -- I've never read the law. Attempting to change the laws of physics is, of course, a sign that the government doesn't have a clue, but what else is new?

I think the best solution is to get a copy of the state statute and read it. You may also be able to go to your local PD or SO and find out about your state scanner law.

Hi Mike

I used to have an old UPS truck with the fiberglass top and built an antenna that tuned from about 20 MHz all the way up to about 1500 MHz, just guessing at the numbers, more likely a little less, let's say 30 MHz up to 1200 MHz to be on the safe side.

The antenna was very very simple and included it's own ground plane, out of necessity to the fiberglass top of the truck, but assume it would work on a metal vehicle as well since the ground plane was to shield.

The antenna consists primarily of two metal disks, the bottom disk is 32 inches in diameter and the top disk is 22-3/4 inches in diameter. The space between the bottom disk and top disk is exactly 5/8 inch.

The coax is connected to the very center of each disk, center conductor to the top disk and shield to the bottom disk.

I used 1/4 inch welded wire fabric for construction, however, solid aluminum or even wire to a loop frame would work as well.

The two plates do not connect electrically, they are separated by insulators, either one in the center on rigid material or around the perimiter on flimsy material. I used nylon bolts with pieces of 3/8 diameter PVC tube for the insulators between the plates.

This antenna cannot be used for transmission purposes as constructed, however a similar version using a 32 inch diameter by 32 inch high cone measured on the hypontenous as the bottom plate (now cone) will

work fine on both 2 meters and 440 with an SWR under 1.8 - 1

Again, the cone can be constructed of welded wire fabric, solid aluminum or even wire to a formed ring.

Maybe that particular Pro-26 was a lemon. When I got my first '26,
it had some problems as well (new out of the box). Then I tried out
the display model in the store and it was perfect, so I kept that one
instead. Yes, the audio could be better, and although it personally
doesn't bother me that much, I'm looking into improving it. Despite
that, I like the Pro-26 _a lot_ for all its other great features,
including its small size and weight, and especially with the mods
done.
Of all the BC and RS handheld scanners I've tried, I haven't found
one yet that does exceptionally well with pagers or image rejection.
The trade-off would invariably be either size, weight, cost, and/or
reduced frequency coverage.

SS (snyders2@pilot.msu.edu) wrote:
: I would like some opinions on what people like to scan. Forget the every
: popular cellular and cordless stuff. What else to people scan? Any great
: frequencies? I just got my first scanner and would like to learn how and what
: you "experts" listen to. Mine is a Pro-43. I would also like opinions on the
: most efficient way to deal with banks? How do YOU have your's arranged?

That's a heck of a first scanner. :)

Here's what I've got my Pro-43 programmed with:
Bank 1: Area law enforcement
Bank 2: Area fire suppression/EMS
Bank 3: Various university frequencies
Bank 4: Local amateur radio repeaters
Bank 5: NM State Police/TX DPS (for driving)
Banks 6-8: Free
Banks 9,10: Itinerant/low power ("dot") frequencies

I've also played around with having dispatch frequencies for law enforcement/
fire suppression/EMS in Bank 1, with the remaining frequencies in Bank 2.
I'm still not sure which way I like better. There is a bit of duplication
between banks 1 and 2, and bank 3, with the university PD and FD frequencies,
but I don't mind. Bank 4 gives me a feel for the traffic on the local
repeaters without having to fire up my HTX-202 (which is 70cm-challenged,
anyway). Since I'm in between Texas and New Mexico so much, I have frequencies
for both state highway agencies crammed into one bank.

I highly recommend clearing space for the so-called "dot" frequencies.
You never know what you'll pick up on these (I usually get fast-food,
plus a few other interesting users). A brute search is usually good
enough for cordless phones, so they're not programmed in there (anymore).
Bank 10 has the dot frequencies, plus a few others. Bank 9 has some
other itinerant and low-power frequencies it, but I sometimes program
other stuff in there if banks 6-8 get full.

This leaves me banks 6-8 free for vacations, air shows, or whatever.

Notice that this is all just public safety/amateur radio/miscellany.
This is what I usually scan, although I have been known to plug in a
few local business frequencies. I may end up putting utilities (like
power, water, phone, gas, and maybe even cable) in bank 6, but it cuts
the free banks, which makes it a pain when I go on vacation (I've already
worn out one keypad).

If I get enough courage, I'll perform the 400-channel mod. (If you guys
don't mind a shameless plug, I've got it, plus the circuit diagram, at

http://www.zianet.com/files/users/kc5kto/mods.html.)

I wrote this a few years ago:

COMPARING THE ICOM R7100 TO THE R7000 RECEIVER

by Bob Parnass, AJ9S

The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Consequently, the R7100 is smaller. A-B tests indicate both the R7100 and Radio Shack PRO-2006 receivers are about equally sensitive, and more sensitive than the 6 year old R7000. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43.

Many of the functions controlled by separate rotary switches and potentiometers in the R7000 are controlled by pushbutton switches and firmware in the R7100.

Deleted Tuning Meter, Added AFC

Too bad the R7000's analog center reading meter function was replaced with 3 indicators on the R7100, a left arrow, a square, and a right arrow. In my R7100, the square lights if you are tuned within 2.5 kHz of center of an FM station, a larger window for WBFM signals. The arrow indicates the direction in which the tuning knob should turned to center the receiver on the signal.

The R7100 has an interesting AFC circuit, controlled by a front panel switch. The AFC will automagically tune the receiver close to the center frequency if you tune near an FM signal. You can watch the frequency change as the AFC steps the receiver in 100 Hz increments (on NBFM). The AFC never quite tunes to the exact center, but tunes within a window set by a difference amplifier circuit, so the station sounds good even though the R7100 is slightly off center frequency.

Modes

R7000 and R7100 users have the same choice of modes, but they are easily selected from front panels controls in the new R7100. A rear mounted slide switch is used for USB/LSB selection in the R7000.

Fancy Firmware for Memory Organization and Scanning

The firmware in the R7100 is much more sophisticated, and a brief article wouldn't do it justice. There are 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. There are many possible ways to scan, more than listed here. You can scan:

all channels
all channels in a given bank
all channels in a given group
all channels in a given group in a given bank

all channels in a given emission mode
all channels in a given emission mode in a given bank

As with most other scanners, there is a lockout bit for each channel, so you don't have to scan the NOAA weather channel even though you have it in memory.

There are 10 pairs of search limits. The search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. I used this for searching for federal stations in the 162-170 MHz range while skipping the NOAA weather channels 162.55, 162.4, and 162.475 MHz, as well as some veteran's hospital paging channels.

The R7100 has 2 VFOs, but Icom calls them windows. There are several window scan modes, but they resemble priority scan modes in a Bearcat scanner.

Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Perhaps a bigger drawback is that both the R7100 and R7000 employs a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

New Memory Query Feature

The R7100, like the Bearcat 200xlt, has a feature which allows you to detect memory channels programmed with duplicate frequencies.

Tuning Step Selections

The R7000 tuning step size is selected using a rotary switch. The R7100 tuning step size is selected by using a pushbutton to step through the selections. The R7100 has more choices, including a 100 kHz step, useful for tuning around the aircraft bands.

Another new R7100 feature is that a tuning step size can be stored into each of the 900 memory channels, so when you use the tuning knob to tune off a memory channel, the R7100 tunes in reasonable increments (e.g., 12.5 kHz in the 450 MHz range, 10 kHz in the VHF-low band, etc.).

Rescan Delay Added, but Nondefeatable

Icom finally included a decent 2 second rescan delay in the R7100 which owners complained was missing from the R7000. Ironically, you cannot defeat the rescan delay in the R7100, so it's now more difficult to scan trunked systems in which the frequency changes with each new repeater transmission! Using the VSC voice squelch helps shorten the rescan delay unless scanning noisy stations.

Power Supply and More

The internal power supply in both radios runs hot. The R7100 comes with a 12 VDC power cord included, an option in the R7000.

The R7000 comes with a handy carrying handle and rubber feet, an $8.50 option on the R7100.

Added Clock and Timers

Unlike the R7000, the R7100 contains a digital clock and timers which can be used to turn the radio on and off, and tune to different channels, several times each day. I probably won't be using timers, though.

Which Radio to Buy

For fast, reliable scanning, you still can't beat a PRO-2006. If you want SSB reception, computer control, or a radio with a tuning knob and lots of features, I recommend the Icom radios.

The R7100 is more complicated to use than the R7000. There are so many firmware controlled features and there are several 2 key sequencies.

Faced with choosing between an R7000 or an R7100 in a similar price range, I prefer the newer R7100. Sensitivity aside, both are about equal communications receivers, but the R7100 is a better scanner, especially for finding new frequencies and organizing memory.

Since I originated this post, I feel the need to fill you all in.

I actually went out and purchased a Pro26. It was AWFUL!
Very sensitive to pager broadcasts. Very difficult to hear when
driving in the car--even at maximum volume. I returned it.

Then a kind soul put me onto Durham Radio in Ontario. A week
later I had my replacement Pro43 and I am very happy with it. Yes, they restored
the Cellular and the 54-88MHz bands. Despite the fancy new features
of the Pro26, I think the Pro43 is outstanding where it counts. RECEPTION!

One final note. I live in Canada where the cellular providers have not managed
to buy a listening law. YET.

Thats if you have the password for the pager, default for advisor is
"ADVISOR". But most companies change them and after 9 times the pager
disables itself, which I know from experience. I think there is a way to jump
it out but not sure.

The ground stations in the Denver metro area operate in the 849.820 to 851.000 MHz range and the aircraft themselves operate in the 894 to 896 MHz range. Both sides use transmit in the AM mode.

The problem is, unfortunately, they are primarily using a form of encryption on their voice transmissions out here. Once in a while there's some clear voice but not very often.

454.725 and 454.775 are the only old air phone frequencies still in use in the Denver area.

There is some good information on:

http://www.cpl.uiuc.edu/~tpeckish/appendix.html

But this page also references the docs that come with the AOR computer interface. I went back to the place I bought my radio and asked for a copy of the documentation for the AOR interface and they had just sold the last one. If someone has this info and it wouldn't be a violation of some law or other, it would be very cool to post it here.

It works fine for me on all bands here in NZ as the antenna is a
multiband TV antenna.
I would estimate my reception has improved 200 % by hooking my scanner
up to the TV antenna and I have an aerial amplifier inline as well.
I have about 40 feet of cable as well so I can move my scanner around
the house and have no problems with it.

Following are Undocumented 3000XLT "toggles".

Power On/Turn on Holding:
==========
SCAN Toggles Scan direction

MANUAL Skips the Welcome message (Only on that turn on)

DLY Toggles delay between 2 seconds or 4 seconds

LHT Toggles Light Mode.
"On Light" - light stays on until LHT pressed again
"Off Light" - light goes off after 15 seconds or so.

AUTO Toggles Auto Sorting frequencies into numerical order during
Scan On or Off. Turning Off will slow scanning down.

Enter Toggles Keyboard Beep On/Off#

SFT & 1 "Test-1"
SFT & 2 "Test-2"
SFT & 3 "Test-3"
SFT & 4 "Test-4"
SFT & 5 Toggles Battery Save On/Off
SFT & 6 Toggles user selection of Mode. With this Off you cannot change
mode from that selected automatically.

Power on/Turn On Holding the keys 2, 9 and..
==========
SCAN Loads Test frequencies into Channels 1-14 and 21-30

MANUAL Resets the Scanner and clears all Memory Channels

L/O Causes the LCD display to light every segment up.

DLY Turns off delay on all channels

Keylock Displays ROM/Software revision.
USA x.xx on BC-3000XLT
Eur x.xx on UBC-3000XLT

There maybe others buts thats all I think I have a note of.

I would find it VERY difficult to believe that the team would not be scrambling their coach-coach and coach-player conversations. Isn't it obvious the other team could go out and get a scanner.

I suppose you could listen in on stadium security people, etc. if that's how you get your kicks, they probably have their own frequency.

4531. 2006 tech help

Newsgroup: rec.radio.scanner
Date: 1996-02-26 00:00:00 UTC

Cross-posted to: rec.radio.scanner,alt.radio.scanner

What is the first IF in the 2006? and what is the REF freq'
for the PLL? Also, is the pre-scaller set to 64/65 or 129/129,
or is this under uPc control?
Is there more than one VCO/PLL? if not, how is the range in
a scanner so wide?

I can control the PLL from the PC but would like the info'
so I know the values to shift in.
Thanks.

TD.

From: rrmoore@iadfw.net
Message-ID: <3131eb9e.2094230@news.iadfw.net>
Source record: 239175

So,
Everyone now knows that there are no currently available cell mods for the late model PRO-51s. But I bet someone could come up with a couple of USEFUL mods for that radio. Maybe one to suppress the annoying beep on every keypress. Also how about one to keep the backlight on instead of automatically going off after 15 seconds.

I'm sure that a cell mod will be engineered soon enough and until then the Virtual Downconverter mod will work for the impatient ones.

best...

From: john@computek.net
Message-ID: <4gsoml$tv2@news.computek.net>
Source record: 239177

I recently bought a used Pro 2006 and preformed the cellular mod to it.
I can now get the frequencies that were blocked out before but I can
not get a 30 Khz step when I am in search mode. I had understood that
as soon as the mod was finished I could select this step rate. Is there
something that I am missing?

Thanks!

Perhaps your scanner has a wider IF filter in the AM mode as
opposed to the NFM mode normally used. Cell transmissions
have a wider bandwidth than normal NFM but not as wide as
WFM. I would agree that what you have discovered is indeed
strange. What your AM mode is probably picking up is any
amplitude variance of the signal that shows up as an artifact
of the FM deviation produced by the cell transmitter not being
perfectly linear with respect to amplitude. I would accept
that I am blowing smoke here, but it sounds plausible anyway.

If you decide to change the mounting scheme to make it vertical, use
caution. Most directional, broadband TV antennas are log periodic dipole
arrays (LPDAs). They have two booms. The booms feed the antnenna.
Don't short them together with your new hardware.

Curtis

>There are different Cordless Phone Freq for different countries......

YES Craig your are 100% correct
for instants here in the UK the base unit is on 1.2 - 1.8 mhz
and the hand sets transmit on 49mhz (legal versions)
Tandy (UK's radio shack division) had to modifi and is not
allowed to sell certain cordless phone that would be ok under FCC
rules because of the freq and/ or output power . before they got
approvel the just re-badged some UK cordless phone

But in the Republic of Ireland anything goes :-)
if it works use it thats their rules (GREAT)
1.2 mhz / 30mhz / 46mhz-50 mhz 70mhz (yes 70
not patching but phones) and 900 and scrambled
panasonic and Sanyo make scrambled cordless

god knows how many more freq's

How, Who, Where, Why, What, When, but mostly Why NOT ?

I'm studying for a job at Radio Shack... mind if I try this one?

BNC = Big Nubby Connector

Then there are the TNC connectors used on cellphones: Tiny Nubby Connector

Oh, and the original... the plain old N connector... Yep... plain Nubby.

>I would, for example, expect an RS sales person to know the diff between
>Narrow FM and Wideband FM, but not something as relatively obscure
>(but great for Trivial Pursuit) as Radio Guide.

Hey... just go in there and watch them try to explain to an elder-folk,
how to interface their cable television in some form other than the
loopthrough in the VCR.

"Hi, welcome to Radio Shack. May I help you?"
"I'm looking for 7805 voltage regulator."
"Do you have the catalog number?"
"Nope, catalogs cost too much... don't need it anyway."
"I can't tell you where it is if you can't point to it in the catalog."
"That's fine, just ring it up."
"Oh, I could have told you where _that_ was."

Reminds me of the time I had a really annoying salesman at the door that had
been trying to sign me up on a service contract, that I had a hard time
getting rid of. Finally he went back to his car and turned on his cellphone.
My roomate walked up to the scanner, which was on anyway, and hit the search
button for a cell BASE search just in time to hear the guy say "I don't know
about that guy on the 400 block, he's just a goof."

The look on his face was priceless when I stuck my head out the door and said,
"HEY! Who you callin' a goof?" For a salesman, he sure got speechless in a
hurry. Never saw him again, either.

What is a myth?

a) a female moth

b) this story

They don't know that the radar gun caused his cancer. Testicular cancer
is a kind of cancer that unfortunately, strikes men in their 30's. That
cop used his radar gun a lot. Someone made up the story that the radar
gun cause his cancer. Most probably, because the one who made the story
up likes to speed and does not like speed limits or radar guns. And so
the story gets propagated.

Picked this up a year or two ago. Haven't tried it on my own PRO-39.
Obviously, proceed and your own risk!

Cellular mod for the RS Pro-39...

Keep in mind that if you decide to make this mod, all responsibility
for any damage to the unit remains with you... If you make the mod
within approx. one hour, you won't lose the frequencies already in
memory.

You will need narrow solder wick, a small soldering iron, a small
phillips screwdriver, a _very_ small phillips screwdriver, some
needlenose pliers, solder.

1) Remove the battery lid and the battery pack.

2) remove the 4 phillips screws from the back of the Pro-39, and lift
off the cover, which separates near the front of the unit.

3) There are two wiring harness connectors attached to the top PC
board. Remove these carefully with the aid of the needle nose pliers,
and keep in mind how the wires lead down to the bottom board (so you
can route them in the same way on completion). Remove the 6 chrome
phillips screws holding the top circuit board in place.

4) Unsolder the ground wire from the bottom right corner of the top
board.

5) Unsolder the two wire connections from the BNC antenna conector at
the board. There should now be just one connector holding the top two
boards together. Lift the top board straight up to avoid bending the
pins on this connector. Set the top board aside.

6) Remove the two chrome screws from the bottom corners of the next
circuit board. One may be difficult to remove without the very small
phillips screwdriver. Unsolder the ground wire from the corner of the
middle board. There is a two wire connector on the bottom board-
disconnect this, and carefully remove the middle board.

7) Unsolder the four corners of the rectangular metal shield, and, noting its orientation for later replacement, remove it from the bottom board. Look for diode D-6, and carefully unsolder and remove it.

8) Put the Pro-39 back together again by reversing the above instructions. Take care not to pinch any wires against the case, and don't overtighten the phillips screws. Test the unit for cellular capability by setting it to scan between 869-894mhz.

I went to a Radio Shack the other day and noticed a new radio
I'd never seen or heard of before. I asked the clerk if it was
a scanner or a shortwave receiver, or what, and she SWORE it was
a scanner. I started asking questions about it, like, what's
the frequency range? How many channels? Etc. She didn't know
as usual. It turned out the radio was a shortwave general
coverage receiver.

Radio Shack employees are stupid. I've never been in a Radio
Shack where anyone could help me with ANYTHING. They know what
TV's, VCR's and cellular phones are, but thet couldn't answer
anything about them. One guy tried to tell me that a cellular
phone could be used in your house as a portable cordless phone.

"Hi welcome to Radio Shack, may I help you?"
"Yes, do you sell radios?"
"Uhhh, let me check, I'm not sure."
"Well, do you have anything electronic in this store?"
"I think so, ummmm, do you have a catalog number?"
"Do you know your butt from a brickwall?"
"Ummmm, I'm gonna let you talk to my manager, he could
probably help you with that."

medjbm@emory.edu (John Mills) asked:
> I'm missing something. What are the new Atlanta PD freqs?

Atlanta's frequencies are currently a moving target. The 12 channel public safety trunk was activated with the police in Nov and within 2 days they'd shut down two frequencies, apparently due to interference with other systems. Since then the fire department has made the switch, and two more channels have died. They borrowed three freqs. from the existing city trunk to make up the slack. The phone patch freq. appears reserved strictly for phone calls. The control channels alternate, approximately every two days.

The status at the moment is:

Atlanta, City of - public safety trunk
856.4625 .4875
858.2375 .4375p .7625c .9375- (-) inactive

Open unit, locate jumper wire L201, clip it, and voila, full 800MHz in 30k
steps, but it also affects the 'pre-set' scan bands such as police and fire.

It works quite well, the military, intelligence community, and other
assorted spooks still transmit RF over the AC line, CATV, and Phone
wiring.

Ah, but this is why we install capacitors across the transformer, now the
RF signal has a path around it. But, your right... in real life we're only
looking to get the signal a few miles away from the tagret site.

Primary usage is for residential targets, and hotels, prisions, etc.

> Office buildings usually have one or two branches feeding a floor, other

Normally the CATV lines are used to get the signal out of the building, it
is then pickup up "on the pole" and coupled into a leased telephone line.

> Private phone lines are best, they usually have a straight line back to the

Righto... and we "load" the transmitter so we get a clean coupling to the UTP.

> >It is possible to maintain a low power signal on the AC mains up to around

But it's a great way to get audio, video, or data several miles away from
the target site!!

>wiring.

This will work only for short distances on the circuit branch.
If you feed your signal down a 120v outlet, it will only be present on other 120v outlets in the building that are fed from the same step down transformer. In an apartment building or housing development you can be sure it will work well, but the signal will not feed backwards through he transformer into the high voltage distribution line.

Office buildings usually have one or two branches feeding a floor, other floors my be on another branch/transformer. Also lighting in some commercial buildings is 240v and fed off another transformer. Similarly a UPS outlet will only feed the RF to other UPS outlets on that particular inverter.

CATV lines are good for longer distances, but each drop is attenuated to prevent interaction. You have to pop in more signal than you might think you need to get enough past your drop's attenuator. The signal will be stopped at the distribution amp, UNLESS the amp is bidirectional and allows submodulated signals in reverse, (i.e. it amplifys 5 or 10 Mhz to 50Mhz in the reverse direction back to the cable company). Cable systems use this to pass data or remote cablecasts pick up signals back to the head end for redistribution on regular channels.

Private phone lines are best, they usually have a straight line back to the C.O. and do not pass through a local switch. The idea is to find the cable with the pair you are using so you can pick the signal up at a remote location. The signal will induct to the other pairs in the cable, but since most cables are armored there is little chance that it will radiate into other cables, except when it gets back to the rack at the C.O.

>It is possible to maintain a low power signal on the AC mains up to around
>50-54 mhz, once the freq gets up to around 200-250mhz the loss to too high

>to be of any value.

This is more due to the nature of a plain copper wire in a grounded
aluminum conduit. There is no guarantee of a constant impedience from one
end to another.

From: lmilrad@passport.ca
Message-ID: <4gukba$mk@diplomatic.passport.ca>
Source record: 239075
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Price is now $450.00 US plus shipping.

The MVT 8000 is 200 channel ac/dc scanner with a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired.

It covers 8 Mhz to 1300 Mhz (continuous without blockage) and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz.

It's got a 10 band search function, pass memory function, and other goodies found in high-end
scanners.

I've been reading the specs on the AR8000. It seems to me that you can actually connect to this scanner and send commands to it with a serial cable and a comm program like Procomm+ or Telix. Is this correct??

Has anyone done this? What's it like? Is it like logging into a computer? If so, that's CRAZY and I love it!

The AR8000 seems to be a fantastic hi-tech device. I'm considering buying one from Javiation in the UK. Has anyone had any experience purchasing scanners from this company?

Thanks for your comments in advance,

Zach

Apparently, the AR8000 can have a 2.5mm socket added to it for an Opto Scout frequency counter. This is for "reaction time tuning" or automatically tuning the AR8000 to frequencies that the Opti Scout detects.

I don't understand.

I thought the scanner was supposed to search for active frequencies. What do you use the Opti Scout for? I've been reading up on this device all over the place, and I still can't figure out exactly what it does. Would some knowledgeable person please give a description of what this device is actually used for?

Thanks in advance,

Zach

>Is it just me, or are the rest of you also sick of seeing all this ham
>radio "Code vs No-Code" and "No-Code = No-Brain" garbage crossposted all
>over the scanner newsgroups?>

Amen.

But you know how hams are - have to pollute the airwaves talking about important stuff like traffic backed up (usually where it NORMALLY backs up), the weather, computer stuff, or calling the wife to select which pizza topings they want to have tonight while on the way home from work.

Now the hams have found the internet where they can continue this waste of bandwidth worldwide in newsgroups that aren't related to ham radios (If this is cross-posted it was in rec.radio.scanner when I saw it), spouting FCC rules while ignoring rules of protocol on the net without remorse. The only rule they seem to follow is to use their callsign as their screen name and put 73's at the end of EVERY post.

I apologize to the 20% of hams out there who don't fit the above description, but I have been slowly surrounded by hams in my two favorite hobbies - scanners and the net - and all of these little annoyances have been building up over the years. It's not the hobby itself, it's the omnipresent attitudes, selfrightiousness, and lack of brevity while on the air that has been gnawing at my ears (and more recently my eyes) and which frustrates me because I am seeing an increase in it. And now hams are getting into TV! Where will it end?

At one time I was actually considering getting a ham license. But after listening to all the nonsense that gets talked about I think a CB would be a much wiser investment - untill I get a continuous band scanner that picks up CB transmissions. The conversations on ham rigs don't seem to be much different than those on CBs.

Food for thought - I've caught more crooks by listening to my scanner in the past two years than I have EVER even heard hams make calls to the police in the past 7 years. That's too bad considering the potential that the hams have with mobile radios.

Send flames via e-mail and stop wasting everyones bandwidth - just focus on mine. If you are a scanner buff and agree, I'd like to see that too!

4572. Highway Zapper FAQ

Newsgroup: rec.radio.scanner
Date: 1996-02-27 00:00:00 UTC
From: xrbarron@ccvax.fullerton.edu
Message-ID: <4guq9p$8ll@news.fullerton.edu>
Source record: 239080

There has been much discussion on the Highway Zapper issue as of late. To catch everybody up on what has been discussed I am compiling a list of some of the highlights of this discussion from the past month or so from various sources on and off the net.

--- What is a Highway Zapper?

A Highway Zapper, also known more loosely as a radar activator, is a small garage-door-opener-type of device that, when the button is pressed, sets off radar detectors that some drivers use to attempt to avoid tickets. Naturally, if the other driver thinks that they may be going too fast, will slow down to TnormalU speeds. They are generally available for about $50 and run off a 9v battery. There has been some questions about legality of using these devices as well, but it looks good if reasonable power lim its are used. There are also some alternative things to think about using for those that want to home-brew their own radar activator.

This is the point where most everybody has an opinion, and the discussion falls into a flame war about speeders. We arenUt going to do that - itUs been done to death. The basic points to these arguments are 1) speeding is bad 2) stopping people from speeding is bad. 3) You are a pickle-headed moron. 4)You suffer from cranial rectal inversion. Repeat ad nausium. My personal reflection on this is that anybody who publicly flames immediately loses all dignity and respect in the net community no matter what the
ir point.

--- Other possible sources for those that like to do a little digging:

RThere was once a magazine construction article which described how to make a small 10.525 GHz transmitter with a strip antenna, which would set off X-band radar detectors within a half-mile or so. Since then a couple of companies have offered kits (preassembled or build [AND **TUNE**] yourself versions). Cruise through electronics and ham magazines for ads from Innotek, Electronic Rainbow ("The Zapper") and JDR Microdevices (a computer parts outfit who are reselling a lot of the Rainbow kits).S

--- Other related ideas:

RThe City of Menlo Park, CA has acquired a bunch of handheld police radar units which it will loan out for a week at a time to private citizens living on streets with speeding problems. The individuals using the radars can write down the license numbers of particularly egregious speeders and the police will send out letters notifying them they've been observed speeding in a residential district and asking them to slow down in the future. I guess there's nothing better to set off a radar detector than a rea
l radar transmitter. For someone who lives on a winding two-lane road having numerous residences, lots of children in them, 17,000 cars/day going past, a 35 mph posted speed limit, an 85th percentile around 48 mph, and absolutely no enforcement, this thread has generated lots of useful ideas.S

RMost x- Band 10 Ghz microwave transmitters work real nice.Check nuts and bolts and you will see some discount 10Ghz microwave for video.S

RI have a couple of surplus dual-tech (PIR/microwave) motion sensors that I'd like to use to "test" radar detectors with :-). By powering them with the specified 12VDC, walking around the room, and watching the indicator lights they both seem to function. The horns are self-contained cast metal assemblies having a cavity with an electrical part (Gunn plexor diode?) stretched across them. One terminal protrudes through the casing and is connected to wire having a positive voltage. There are small screw adju
stments, I assume to be used a fine tuners, that are glued in place and intact. Both seem to have a pot used for microwave sensitivity adjustment.S

IUve heard of people getting surplus motion detectors from supermarket sliding doors and hooking them up to do the same thing. They operate at 10.525 GHz - the same as X-Band radar, and are usually 12vdc to boot.

Check out the June 1995 issue of Popular Electronics (not Popular Science). They have an article on how to build a radar gun from scratch or from a $100 kit available from Ramsey Electronics. The kit is highly suggested due to the availability of some parts and the nature of the circuit board. You supply a 12vdc power supply (ie: car battery) and two coffee cans and you can make a radar gun that operates at 2.6 GHz (too low to set of detectors).

Ramsey Electronics

Home Built Units

Electronic Rainbow sells the Zapper II as a kit which is a modified version of the original Zapper. Instead of a single button for zapping, there is a small Ttest switchU and a code key input for morse code practice or possably remote mounting and control of the unit. It is a small, simple circuit with 3 resistors, a trim pot, a capacitor, and two transistors.

You will also need misc. parts for it such as a push button, a LED, and a 9 volt battery snap. The caps and resistors are surface mount parts and thu
s a little more difficult to come by. You should be able to find them in packs for about 20 to the dollar. Substituting through hole parts is a bad idea since the lead lengths will affect the radio frequency circuit.

If you get the Electronic Rainbow kit book for $15, you get the plans for the zapper on page two. There is a layout for making the printed circuit board which is fairly small - 2S by 3/4S - but beware, it must be on .031S teflon board. Standard copper clad will not be able to handle those high frequencies according to the guy I talked to at Electronic Rainbow. If youUre not much for making a printed circuit board, they sell one for $13.

The toughest thing to get is one of the transistors. Normal parts places donUt carry it. It is a GaAs FET Avantek AFT 26884-STR. Rainbow sells them for $13 each. One of the leads has to be cut off, and another one solders to a trace on the board that needs to be trimmed to me right size to give it the proper frequency. Trimming that strip by 1/64th of an inch will increase the frequency by about 50 MHz. They are very small and sensitive to static damage so a grounding strap and grounded soldering iron are m
inimum precautions. If these are not used, the GaAs FET could be slightly damaged and fail without warning some time after the unit is built.

Besides the board and GaAs FET mentioned above, you will also need one of each of the following parts. 33 Ohm, 51 Ohm and two 270 Ohm surface mount resistors, .01 uF surface mount capacitor, 1K surface mount variable resistor, LM 317 LZ transistor/voltage regulator, wire for 3 jumps, push button switch, 3.5 mm code key jack, red LED, 9V battery connector, white plastic screw, 1/4S plastic spacer, LED holder, case with front panel, and hook up wire for connecting the switch, LED, and code key jack to the bo
ard. Unless you have most of thses parts already, it would be wise to buy a kit with all the parts from Rainbow Electronics. I found this out about $100 and 6 long distance calls too late.

Legality

The Zappers are no longer sold as radar transmitters, but rather code practice transmitters for the radar range of amature radio. These are tuneable by use of a trim pot to shift the frequency to that of a radar detector. The FCC would probably frown on that.

As long as you stay below 100 mw you should be safe. Most Highway Zappers are 10mw or so, but some home built units have been reported to transmit at up to 250mw! Check before you buy a kit to avoid any problems. Also check FCC rules part 15 for specific limitations. Section 15.122 is pretty specific about unlicensed devices and what guidelines they must follow. At radar frequencies this section states that they device must not have a field strength of over 5000 micro-volt meters at 3 meters, plus something
about a limiting device to not allow it to transmit for longer than 1 second.

Document FCC 78-326 is an interesting read about a request by the Washington State Traffic Safety Commission requesting a rule change regarding anti-radar detector drones. The state wanted to install many of these devices about every ten miles or so in their area, but was denied for the following reasons:
RAs our staff has previously advised you, the device has not been type-accepted by the Commission; the intended use is not permissible under the Commissions present rules; it would not qualify as a Tfield disturbance sensorU under part 15 of the rules; and it most likely would not meet the duty cycle limitations imposed upon other low power devices which

may be operated without a license under part 15.S

That was in 1978 and probably about more powerful devices than the zappers affixed in permanent positions. More recently the following post was found in support of their legality.
RThe owner said the FCC did get on him for his Zappers even though they emit power levels below the min necessary for transmitter licensing or type acceptance etc...
He advertises it as a 10ghz ham radio xmitter now which btw also tests radar detectors. He added a CW key input(really) and make the big red button on top a little red button on the side. No price change. $39.95 kit and $49.95 built (if memory serves me correctly). He said that satisfied the FCC and they will be marketed as I mentioned.
His sales were brisk and he was looking for dealers.S

X-Band radar (which is what the zappers use) is 10.525 Gigahertz. The upper end of the ham band reportedly stops at 10.500 GHz, 0.025GHz below the Zappers frequency. Ham operators can get in trouble for transmitting in this range.

These are completely different in form and function to radar scramblers and should be inert to police traffic radar. You can check with your local police department to be completely sure. Heck, some police departments own them (or similar devices) and use them on highways to control traffic. I think the following post sums that type of thing up nicely.
RHowever, if you want to jam police radar, you may be falling into other legal areas like obstruction of justice -- definitely more serious. Many radar jammers transmit a signal typically modulated with a square wave to deceive police radar. I've seen a number of police radar units that have a speaker which allows the officer to listen to the Doppler shifts. Low frequency tones are heard when a slow target is detected; high frequency tones are heard when a fast target is detected. A jammer would sound
like buzzing. An officer could recognize this as an attempt to jam him. So there is a definite risk of being caught with a jammer - it might not be for speeding but it could be more serious.S

As for the interference with police radar, I posted that question on a law enforcement board and got this reply among others that generally said that they donUt cause any problems with police radar, and if a cop saw one in use, they probably wouldnUt have a problem with them because they help them more than anything, assuming that they knew what it was.
HereUs some of the replies I got:

RRich.... I did try that, just to see what would happen. I had one of the Zappers and another unit that was home-brewed and sold by a local resident. Using two of our MPH Industries K-55 units (X-band of course, and one at a time), I transmitted the Zapper and the other unit directly at the radar antenna from various distances. Nothing happened. No speed reading at all, even when the Zapper was 1 inch from the antenna. So, interfering with police radar with one of those types of units isn't a problem fo
r anyone. I have HEARD (not seen) about some units that transmit a much more powerful signal in an attempt to foil traffic radar, but have only had REAL confirmation about one being effective. That was from the 2/95 issue of Corvette Fever, where they did a test of various Radar/laser detectors and other devices that claim to thwart traffic radar or laser. Only one worked, a $500 unit for X-band radar only. You'd have to be a very serious violator, and hope that you don't run into K or Ka band radar or
laser. I don't know of anybody like that, hihi.S

R Kentucky Department of Transportation several years back installed small silver boxes with small windows on them that transmit a carrier signal on radar solely for the purpose to prevent the use of radar detectors on Interstate 75 coming into Cincinnati. They were installed on overpasses and telephone/utility poles about every half mile or so. This situation was made public a few years back and KDOT specifically stated the purpose and advised that in doing so was not in violation of any Federal Law.
Of course this provoked a very heated debate with the public. Threats of vandalism were made and the last that was heard was any one caught damaging such devices will be prosecuted for willfully damage or destruction of public property. After many years the motoring public finally accepted that the use of radar detectors in this 5 mile stretch of highway was limited to the "off position" until motorist cross the bridge into Cincinnati.S

--- Uses:

1. Obviously the single best use of these devices is to slow the guy that just blew past you doing 90mph.
2. You may also be interested in testing the radar detector you plan to purchase (or demonstrate if you are selling them).
3. Activate the unit and see what break lights come on ahead of you, then reel Tem in.
4. If there are more than one radar equipped cars, see if you can keep them in a group or single lane as long as possible. As soon as someone pulls out to pass, hit the button again and watch them fall back into line.
5. As a speeders aid - to break up those pesky groups of cars only doing 60 and blocking all the lanes. Chances are one will have a radar detector and slow down, breaking up the pack so you can get by.
6. A code practice transmitter for morse code

---Final notes:

I havenUt seen anything that limits these specific devices in regards to the law. If anything should pop up, please follow the law.

You can contact me to make corrections/additions to this list at: xrbarron@fullerton.edu until the Summer of T96.

Greg,

I would return the R-7000 to ICOm for expert repair. The 7000 is too nice to play around with! And as you probably know, the radio is difficult to replace.

I own one along with a R-7100. The bad news is that ICOM repair takes about 1 month turn around time from the time they receive the unit in Washington State.

Good Luck,

Joe Cardani

I have a Bearcat BCT-2 Multi band Scanner (that I have hardly used)
for sale.

It's a pretty neat device in that not only you can just punch in the
state that you are in (and it picks up Police, Highway Patrol, DOT,
weather, etc.) It also alerts you to the presence of radio waves in
the vicinity (has a large red light and beeps). That way it offers
protection from Vascar, airplanes, etc). It retails for $250+ and
mine looks brand new. Includes cigarett lighter plug, mounting
brakets, car radio antenna splitter/and wire antenna (that attaches
to your windshield with small suction cups).

$$ Best Offer.

>available cell mods
>for the late model PRO-51s....

The PRO-51 and BC220XLT are similar, so why can't the PRO-51
be modified for expanded frequency reception like the BC220XLT,
as described by Steve Donnell, WA1YKL? The technique, applied to
the BC220XLT, was described in Steve's Mod House column in Nat Scan
or in the RCMA Scanner Journal (I've forgotten which), and more
generally in Feb 1995 Monitoring Times.

Only a subset of modifications are available on the Internet.
I subscribe to several radio and electronics magazines and see
modification tips for radios which people claim are "unmodifiable"
merely because they haven't found a mod file on a BBS or web site.

Read up and tinker on.

>56 Mhz.

Scanners themselves don't "use" any type of polarization. It is true
that most of the transmissions in the VHF/UHF spectrum are vertically
polarized but after you consider bounce/reflection of signals, the
horizontal/vertical issue is not real important. Also, the 75/50 ohm
issue is not important. Even for transmitting, the 75/50 ohm mismatch
is acceptable at low power levels.

>However, even with these differences, it still may work better than the
>rubber duck antennna at ground level. It can't hurt to try. You'll probably

Please note that "LAFD" is CASE SENSITIVE. It simply
will not work in lower case. It took me quite a while
to figure this out.

Brian, perhaps you could suggest to your webmaster that he/she
either reconfigure your site to not be case sensitive, or to
have two versions of the data.

Also, there seems to be a problem when displaying the list
of fire stations, at least when using Netcom's Netcruiser.
Perhaps you could ask your webmaster to take a look at this.

Thanks for being so open with information about the LAFD.
I wish that your counterparts in the LAPD were like this.

I find it quite refreshing each time I learn of others that enjoy
working QRP. I have a fairly modest station consisting of an Icom
IC-701 with a 40-meter dipole in the attic of my apartment. I may not
be able to work Australia at the flip of a switch, but I always get a
contact when I call CQ.

>Don't let a few "bug" you when the majority welcomes you.

Agreed. I don't read the rec.radio.* news groups often because I'd
much rather enjoy a curteous conversation on HF than read the
bickering that goes on here.

If I split the feed for my TV system in my house between the TV antenna
and the scanner antenna, will this work effectively?

4592. Radio Pages

Newsgroup: rec.radio.scanner
Date: 1996-02-27 00:00:00 UTC
From: asperges@innotts.co.uk
Message-ID: <31334b71.2745810@news.innotts.co.uk>
Source record: 239100

The local server recently changed its DNS number. Some people have
complained they can't access my pages any more.

You should be able to find them under:

http://www.innotts.co.uk/~asperges/

but if not, instead try:

http://194.176.128.13/~asperges/

and it should work. This is the new DNS address.

The pages contain info of interest to Radio Amateurs, Radio
enthusiasts and Short Wave listeners.

* There are links to many other pages, newsgroups, ftp etc;
* A mock exam;
* Questions and Answers for newcomers;
* IRC links
* Links to Friends on the Net (mostly homepages involved in radio)
* The new Short Wave Listener pages with links to Broadcasters on the
Net.
* The Russian link;
* Sources for help;

There will be new updates in March.

Why not call the Mercy Air business number, and ask the communications supervisor what frequency
they use. I don't mean to be smart, but I got alot of my information by just asking. Normally, the communications personnel know the frequencies that are used. Most times thay are glad to assist! Fire and Medical information is much easier to obtain than law enforcement.

Jim:

Last time I read the law, it was still legal to own a Cellular capable scanner. You could also
sell it. I belive the law only applied to importing additional Cellular capable radios into the
U.S. after the law was passed.

When you think about it, maybe it's illegal to own a Cellular phone! :)

Internationl Communications treaties still require the Morse code for
any one wanting to operate in the HF bands 160-10 meters. There are
plenty of U.S hams that have petitioned the FCC to drop the code requirement
but the FCC has rejected all such proposals. Things have changed though
at least there is no code requirement for the VHF and higher bands.
I started as a No Code Tech but quickly upgraded so I could operate on the HF bands.

: I have been noticing lately that many people post requests for mods in
: these radio groups, and not getting answers. The best way to get mods,
: though, is not to post to a newsgroup.

I think that's because they keep asking for cell mods for post-ECPA scanners. It might be time for somebody to write an "ECPA and the Non-Cell-Modifiable Scanner FAQ" and periodically post it here. On second thought, that might not work either - look at all the dolts who keep posting looking for the 25 cordless telephone frequencies. (Don't these people read???)

If you're looking for mods for Radio Shack scanners, you can try my Radio Shack Scanner Modification Page, at

http://www.zianet.com/files/users/kc5kto/mods.html

: Whatever you do, don't pay for mods!

I agree wholeheartedly.

>three nearby freqs.

I'm sorry. When I said no "audible" results I meant no voice. I did get some digital junk that would come in and out throughout the 902-928 range. It was an extremely weak signal as well. I would never get a dedicated channel that always had digital noise on it.

4606. Sacramento (Citrus Heights) frequencies?

Hold down both "CLEAR" and "0" while turning on the power. This clears all
programmed channels from the scanner.

Although this problem has been alleged a number of times, radar gun cancer as never been proven. There have been studies done, with conclusions supporting both sides of the dispute. Guess it depends on which "expert" is talking at the moment. There also have been 5 lawsuits filed over this by law enforcement officers, all against Kustom Signals. 4 of them never went to trial. In the one that did, Kustom was found to be not negligent. Of course, that doesn't mean that radar guns don't cause cancer, and I would sure like to know the terms of the out-of-court settlements in the other 4 cases. Law enforcement officers come from a cross-section of the community, so many of them don't know anything about RF energy, and I can sure see them placing this always-on radar gun in their laps. IMHO, its gotta do some damage after a number of years. Good thing very few departments use these hand-held radars any more. What about all the allegations of handheld cellular phones causing brain cancer?? They put out 300mw (vs 15-50mw for radar units). Thats something that would effect far more people. Anything to it?

Do watch the phone you get. There are a few 900 MHz analog phones that
can be scanned, then there is the digital and then the spread spectrum.
Neither is scannable by a scanner, although there surely will be someone
somewhere who will work until they can d -> A the signal.

For immedeate sale:

- Icom W21AT Dual band handheld with 50-999MHz recieve
- Two BP-157 battery pack with built-in whisper mike for full duplex
-These are over $100 each retail!!!
- Wall charger
- Manuals and schematics

I used this radio only for Rx at home (nice for it's wide coverage), but I just got a new base scanner that does the same job with more 'scanning' features (more memories, but no cell...). I need to sell this radio to pay off the scanner bill that will be coming in the mail any day now. Everything is in like-new condition, no scratches or markings of any kind. I'd like $350 for the lot, but the best offer will get it. Also, to fastest offer will get it!

Thanks,

Dave

I just purchased a Radio Shack Pro 2036 scanner. I believe this is is the same radio as a Bearcat BC 890XLT. I purchased the radio to monitor some of the local HAM repeaters in the area, but am having problems with some of the 220 Mhz frequencies. Once I get the radio in the 220 Mhz band it will only allow me to make steps of 12.5 or 25 Mhz. The 5 Mhz step is no longer available. Even if I Manually enter the frequency it will round it up to the closest 12.5 Mhz. Does anyone know of a MOD for this?

I would also be interested in any other MODs for this scanner., or Information on where to connect a S Meter.

Thanks for your help in advanced.

Works fine.....I don't worry about the horizontal polarization (did
you ever see a horizontally polarized TV transmitter tower?), secondly
i used the existing cable, the 75 ohm mismatch doesn't hurt that much
especially on recieve only applications...and oh yeah, I cheat with
the TV pre-amp. ....Dan

<<What's a crystal?>> You MUST be kidding!

Seriously? In the OLD days of scanning/monitoring, way before there were direct-entry programmable scanners, before you had 1000 channels or even 100, there were handheld and base/mobile scanners of 2,3,4, 10, 20 channels that needed a "crystal" for each frequency.

I rarely post it 'cause it's BIG. The FAQ tells where to get it. But
just this once . . .

From: bbb@kuhub.cc.ukans.edu (LORD BB)
Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

The first [part] will be the txt of the article.
This will be followed by a UUencoded GIF of the pictures.
This was published in World Scanner Report in (May?) 94.
Enjoy. I'll be glad to answers any questions about it.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu

INTRODUCTION

The following document details two enhancement modifications that are
possible on the Radio Shack PRO-43 scanning radio. The first modification
doubles the factory standard memory capacity, allowing you to enjoy an
additional 200 channels of memory, plus 10 more monitor memories. After
completing the first modification, it is a fairly simple matter to add a 7 to
10 second delay feature to the LCD back-light lamp circuit. I designed and
performed these modifications on my PRO-43 and they do work. As I understand
it, there (has been/is being) presented in WORLD SCANNER REPORT a similar
memory expansion. I have not seen this modification and for all I know it is
a better way of doing it. What is presented is a 'clean-room' design of my
own that to the best of my knowledge is the only one to also offer a time-
delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO
SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE
HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE

THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

THEORY

When studying the schematic for the PRO-43 one sees that the channel memory is organized using two 93C67 EEPROMS. As is common in microcomputer designs, the memory is all connected together on a common bus, with the individual memory devices being selected with a Chip-Select (CS) control line. The 93C67 are particularly simple, in that they are serial devices, only requiring 4 signal lines. (Data In, Data Out, Data Clock and CS) This inspired me to consider the possibility of adding two more EEPROMs, creating in effect a second 'bank' of 200 channels. One could then, presumably with the flip of a switch, choose between the original 200 channels, and a second bank of 200 channels. (In theory, this could continue to 600, 800, 1000 etc. channels. In practice however, space is very tight in the PRO-43, and getting anymore

memory installed would be very tricky.)
Switching two CS lines between two pairs of EEPROMs requires the equivalent of a DPDT switch. While it might be possible to do this with a mechanical switch, the physical implementation of this could prove to be very difficult. Rather than use a DPDT switch, I chose to use a CD4053 triple 2 channel analog multiplexer/demultiplexer. This CMOS analog 'mux/demux' can be viewed as a triple SPDT switch. Two sections of the CD4053 are wired in such a way as to act as a DPDT switch. The advantage being that a DPDT switch can be controlled with a SPST switch, and no actively switching digital signal lines need leave the area of the CPU. At this point one is still faced with the need of a mechanical switch to control the CD4053, albeit, only a SPST switch is needed. It was suggested to me by someone on the Internet, that the 'Keylock' switch might be a good candidate. And indeed it is! While it might be nice, once in a while, to be able to disable the keyboard, it is more than a fair trade to give this up for more memory. Thus I used the Keylock switch to control the DPDT switch made from the CD4053.
Good design dictates that the state of all signal/control lines are always in a known state. The 93C67's CS lines are active high leading to the need for pull-down resistors on all 4 CS lines. This insures that the 93C67's not currently being used will have their CS lines pulled to ground. I accomplished this with 100K ohm resistors connected between the CS line and ground. Physically I implemented this using a resistor array (SIP package) containing 5-100K resistors all having one common lead. The 5th. resistor is used to pull-down the CD4053 control lines making up the DPDT switch. This is necessary when the Keylock switch is in the open position (unlocked) since the line must be driven low.
This leaves a SPDT switch in the CD4053 not being used. Studying how the lamp circuit works shows that the keyboard light switch grounds the base of Q1 to turn on the lamp. Using the CD4053 to act as the switch to ground, and placing a large RC time constant circuit on the control line of the CD4053 will allow for a time delayed lamp modification. Because the input impedance of the CD4053 is extremely high, a small valued capacitor and large value resistor will work. In my design I used as 1 uF tantalum capacitor and a 10 MOhm resistor to form the RC time delay. The Pro-43's keyboard light switch is connected across the capacitor to discharge it when depressed. This causes the CD4053 to switch on, grounding the base of Q1. After the switch is released, the capacitor begins to charge through the 10 MOhm resistor. When this voltage reaches approximately 1/2 VCC the CD4053 switches off, and the lamp goes out. (One caveat: When the radio is first turned on, the capacitor is discharged and therefore a lamp timing cycle will begin with each power up.)

PROCEDURE

REMEMBER TO ALWAYS WORK AT A STATIC FREE WORK-STATION, INCLUDING THE USE OF GROUNDED SOLDERING EQUIPMENT AND THE WEARING OF STATIC REMOVAL BRACELETS.

The first step is to build the switching assembly. To build this first tin the leads of the surface mount CD4053 and the resistor array. Following the connections shown in the schematic (figure 1), attach short (3/8" to 1/2") pieces of wire wrap wire between the 5 resistor leads of RA1-NEW and pins

1,2,3,5, and 9-10 on the CD4053. (You should always: Size, cut, strip, tin and trim the wire before soldering it to the CD4053. Doing this makes it fairly easy to get good solder connections.) Connect the common lead of the resistor array to pins 6,7,8 and 12 of the CD4053. If done correctly you will have the resistor array laying flat on its side with its leads facing the CD4053 as shown in figure 2. This makes the assembly very thin. Inspect the solder joints with a magnifying glass, and give them a gentle 'tug' to make sure they are securely soldered. The PCB board drawing on page 19 of the service manual is an actual size drawing. Check to see that your assembly will fit into the area just above IC1 and to right of IC2.

Soldering to the pins of RA1-NEW, connect 4 - 2.5" lengths of wire to the resistor leads going to pins 1,2,3&5 of CD4053 (This makes up the 4 switched lines going to the CS pins.) Connect a 5" length of wire to the resistor pin connected to pins 9&10 of the CD4053.(This will go to the Keylock switch.) Attach a 2" piece of wire to the resistor lead attached to pins 6,7,8 & 12 of the CD4053. (This will be the ground connection.) Attach 3 - 4.5" long wires to pins 4,15,&16 of the CD4053. These will be the two poles of the switch and the VCC connection respectively. Finally attach 2 - 5" wires to pins 11 & 14 of the CD4053 if you intend to also add the lamp timer modification. At this point you should have a strange looking device with 11 wires sticking out of it. DOUBLE CHECK YOUR WORK AND SOLDER JOINTS AT THIS POINT.

The next step is to check the operation of the switching assembly. Using a 5-10 volt power supply, apply power to the assembly. Using a DVM, check to see that there is continuity between pins 4&5 and pins 15&2 while the control line (the wire attached to pins 9&10) is not connected to anything. And also check to see there is NO continuity between pins 4&3 and 15&1. If that checks, attach the control line to VCC. There should then be continuity between pins 4&3, and 15&1 and no continuity between 4&5 and 15&2. Next check for continuity between pin 14 and ground when pin 11 is grounded. The resistance between 14 and ground should become infinite when pin 11 is then connected to VCC. After check-out put the assembly aside in a static proof container.

Using extreme care bend all the leads, EXCEPT FOR PIN 3, of one of the 93C67 so that they are pointing as straight DOWN as possible . Bend pin 3 so it is sticking straight out from the body of the chip. These leads are very fragile and I suspect they will only accept a single bending before breaking,. After the leads are bent, carefully tin all leads. Put the EEPROM back in its carrier, and repeat on the second EEPROM. The next step is to prepare the scanner for the switch assembly. From here on out, "The cheese becomes more binding," so work carefully and think about everything twice before doing it! Remove the battery compartment lid and battery. Remove the 4 case screws and the back of the case. Disconnect the two wire connectors on the RF board. Desolder the antenna feed line and its ground connection. Remove the 6 screws holding down the RF board and remove it from the audio board. Disconnect the speaker wire from the audio board, and remove the 2 screws holding it to the front of the case. Separate this from the front of the case. Desolder and remove the RF-shield from the logic board. Wash your hands to remove as much skin oil as possible! Remove the screws holding the logic PCB. Turn the unit over, and with your hand supporting the PCB lower it from the case front. The reason for this is that the LCD assembly will stay with the board. If during

this process the LCD and its backing glass do separate, handle them as little as possible. Also note the back-glass has a white frosted side. The frosted side, the light diffuser, is placed away from the LCD panel. Remove the rubber keypad, and locate the two traces running to the Keylock switch. Using a sharp utility knife, cut both of these traces near the switch, examine the cuts with a magnifying lens to make sure the switch is severed from the rest of the board. Avoid touching the keypad contact area as much as possible. Checking to make sure dust has not entered the LCD view area, put the logic PCB back in the front of the case and secure it with its screws.
Locate IC2 and IC3 EEPROMs on the logic board. Add to each of the pins on both chips a small amount of solder. This will be necessary to attach the new EEPROMs. Of course you must make sure that you form no solder bridges. At this stage I suggest you re-install the audio board and RF board. (There is no need to solder the RF shield back on, nor should you resolder the antenna connections.) By holding the battery in place and slipping the battery lid into proper position, it is possible to power up the radio without bothering with the case back. Check to see that all keys are functioning correctly except for the Keylock switch, and that the display looks normal. You are now ready to begin the 'fitting' of your switch assembly into the radio.
Locate the area just above IC1 and to the right (as being viewed from the backside of the radio) of IC2&3. There is a relatively open space here where the CD4053 and resistor array can lay. Cut a piece of thin card board stock to be slightly larger than the area taken up by the switch assembly. This will serve as an insulator between the logic PCB and the assembly. Keeping the assembly in its final position, start sizing the lengths of the wires. The wires connected to pins 1&2 of the CD4053 must reach IC3 pin 3, and the wires on pins 3&5 of the CD4053 must reach IC2 pin 3. Remember when cutting these down to leave enough extra wire for stripping, tinning and final trimming. The wire connected to pin 15 of the CD4053 must be long enough to reach the TRACE on the PCB going to IC3 pin 3. Likewise the wire on pin 4 of the CD4053 must reach the trace running to IC2 pin 3. The switch control wire (pins 9&10 of the CD4053) must reach down to outside most solder pad on the Keylock switch. VCC, pin 16 of the CD4053, is sized to reach the 82 ohm resistor R26 located next to Q1. The ground connection can be made on the large copper area under the switch assembly after scraping a small area of solder-mask off. After the wire lengths have been determined, strip and tin the ends of all the wires and set the assembly aside.
Using a sharp knife, cut the trace running from IC1 to pin 3 of IC2. Repeat this for the trace running from IC1 to pin 3 of IC3. On either side of the cuts, scrape off a 1/8" area of solder mask and tin the exposed copper. Be careful not to damage any of the surrounding traces or components. Place the switching assembly in its proper location and solder the ground wire to the solder-mask free area you made near IC1. Attach VCC (pin 16 of the CD4053) to the top of R26. Attach the pin 5 wire to the cut trace that runs to IC2-pin 3, and attach the pin 2 wire to the cut trace running to IC3-pin 3. Next attach the wire on pin 4 of the CD4053 to the trace running to pin 18 (previously running to IC2-pin 3) of IC1. Likewise connect the wire on pin 15 to the trace connected to pin 19 (previously running to IC3-pin 3) of IC1. If done correctly you now have 4 wires running to the four 'new' connection points made by cutting the two CS line traces. Connect the wire tied to pins

9&10 of the CD4053 to the outside (left side) conductor of the Keylock switch. Attach a new piece of wire to the center conductor of the Keylock switch. Size and connect the other end of this wire to center lead of IC5. (IC5 is low battery detector for the CPU. The center lead of this is connected to 5 volts which is sufficient to switch the CD4053. Later we will need to attach another connection to R26, and squeezing 3 wires to this single point would be tight so I used the 5 volt bus for switching.)
Place the insulator under the assembly and tape a corner in place so it will not move. Cut another cardboard insulator big enough to cover the switching assembly, and place this on top of the logic PCB. Bending the currently disconnected wires (pins 1,3,11,&14) in such a way that they don't short to anything (or each other) , install the audio board back in to the radio. Install the RF board and prepare to power up the radio. Making sure the Keylock switch is in the UNLOCKED position, turn the radio on. It should begin to scan normally. (Believe me you will breathe a big sigh of relief when it does!) Turn the radio off, move the Keylock switch to LOCKED position and turn the radio back on. You should see it either scanning frequency 000.0000 or the frequency field will be blank, with the channel counter incrementing. After a few seconds, the frequency number always blanked out and the am/fm indicators blinked randomly on my radio. If you are unable to make the radio scan correctly, there is something wrong with the switch assembly or your connections.
The next step is to install the new memory. The leads on the new memory are not long enough to reach the leads of the factory memory. Trying to solder bridge the gap is difficult accomplish without also bridging adjacent pins. The best way I found to do this is to use tinned wire wrap wire. So the first step here is to tin about 6" of stripped wire wrap wire. Remove one of the new 93C67s from its carrier and place it on top of IC2, making sure that the extended pin 3 is over pin 3 of IC2. Put a droplet of solder on the tip of your soldering iron. While holding down the memory with a finger, apply the soldering iron to one of the corner pins of both ICs. The droplet should 'jump' over the gap between the pins and solder them together. Check both sides of the EEPROM to insure that all pins are accurately aligned. For the remaining straightened pins, proceed as follows:
While holding the tinned wire wrap wire against the lower and upper pins, apply a freshly cleaned soldering iron tip to the gap area of the joint. The extra solder you earlier placed on the factory EEPROM will then be available to flow along the wire and solder to the pin of the new EEPROM. CHECK the joint with a magnifying lens. After a visual conformation of the joint, clip the wire close to the pin of the newly installed memory. If you like go back to the first pair you soldered and lay the wire into the molten solder. Repeat for IC3.
Attach the wire connected to pin 3 of the CD4053 to pin 3 of IC2-NEW, and connect the pin 1 wire to pin 3 of IC3-NEW. Install the cover insulator over the switch assembly and prepare for a power up. With the Keylock switch in the Unlocked position power up the receiver. After insuring that the factory memory is still working correctly, power down, switch to the Locked position and power up again while holding down the 0 key and the Clear key. You should now see the radio scanning frequency 000.0000 for all 10 banks repeatedly. Press the PGM key to stop scanning and enter a valid frequency value and press

enter. Press PGM, then the DOWN-ARROW, then PGM again. The frequency you just programmed should now be on the display. (At this point feel free to cheer! YOU have just added 200 more channels to your PRO-43. The next step will be the icing on the cake!)
This next step requires you to lift the BASE of Q1 from the logic PCB. (I found this to be very difficult, in fact, I ended up destroying Q1. Thus the extra Q1 in the parts list.) Desolder and lift the Base lead of Q1 from the logic PCB. Solder together one lead of R2, the positive terminal of C1 and the wire from pin 11 of the CD4053. Also from this junction, connect a wire to the solder pad on the logic PCB where Q1's base was connected. The area to the right of the Keylock switch provides a space where these components can lay. Connect the base of Q1 to the wire connected to pin 14 of the CD4053 switch assembly. The other end of R2 is connected by wire to the top of R26, this provides the charging voltage for C1. The negative lead of C1 can be connected to the RF shield ground pad near the Keylock switch. (Check that the RF shield will fit in place over C1. If it will not, place C1 so that its body is just below the bottom of the shield. Insulate the R2-C1 combination with electrical tape. Tape the switch assembly's top insulator cardboard in place and install and solder the RF-shield back onto the logic PCB. Prepare the radio for bench power up.
Turn the radio on, the lamp should come on. After 7 to 10 seconds the lamp should go out. Check in a darkened room to insure that the lamp completely extinguishes. Depress the light switch on the keyboard. The lamp should immediately light, and stay lit for 7 to 10 seconds after it is released. Install all the remaining screws for the RF board, solder the antenna lead and ground connections, and replace the case back.

USAGE
The light feature is self explanatory, and quickly finds itself useful in darken conditions. As noted earlier an unfortunate side-effect of the lamp circuit design is that the lamp will illuminate for 7 to 10 seconds every time the scanner is first turned on. (Maybe this is a feature to some.) Switching between active banks requires a little more thought. The safest way of changing banks is to: Turn the scanner off, switch banks, and then turn the scanner back on. But sooner or later you will switch banks while the scanner is on. When this happens you will see a curious event. The radio's CPU will continue to scan from the previously selected banks, but the frequencies scanned will now be those from the on-line EEPROM. This makes sense, since the CPU has no knowledge that its memory resources have been changed. Pressing the Manual button, followed by the Scan button, will cause the CPU to reload the scan banks that were last saved in the currently selected EEPROMs. Also any monitor frequencies that were stored are recalled. This allows you to set up two different frequency configurations, one in each bank of EEPROM. To change between them on the fly, just flip the Keylock switch, press the manual button, followed by the scan button. The only time I can foresee there being a problem is if some how one were to flip the switch while the CPU was doing a write to EEPROMs. Keeping this in mind you should never have any problems.
There are a couple of 'gotch-ya' that can happen when switching memory banks without cycling power. The PRO-43 loads the list of all locked-out channels

only when it is first powered up. (This makes sense if you think about it. While I don't know for a fact, I assume that the Lock-out information for each channel is stored together with that channel's frequency in the EEPROM. If the CPU didn't pre-load the list of locked out channels, it would have to constantly re-read each channel to determine its lock-out status.) The side-effect of this is that it can cause the radio to appear to be randomly locking and unlocking channels when switching memory on the fly. The only realistic solutions appear to be to either cycle power when you switch memory banks, or use Lock-outs very sparingly. The Priority channel assignment is also loaded only when power is first applied. This can make the radio start checking the wrong frequency when memory is switched and the priority feature is used. The best way around this problem seems to be to assign the same channel number to be the priority channel in each memory bank.

CONCLUSION
Performing the described modification will provide the owner of an already excellent hand-held scanner, the convenience of a total of 400 channel memories and 20 monitor locations, doubling the factory capacity for under $40.00. It also provides a "fade away" LCD back-light with a 7 to 10 second delay. The bank switching nature of the design allows for the user to program two unique 'personalities' into the scanner selecting between them with the Keylock switch. The modification while complicated can be performed by any person with moderate to advanced electronics experience.

Below is the UUencoded GIF image.
You will need a uu-decoder and a gif
viewer. If you dont know how to do
either of these, consult with a local
'guru' in your area, or get the FAQ
from one of the binary.picture news
groups. I will ignore requests for help
that deal stictly with the viewing of this

>
> TD.

The first IF is in the range 607.505 > 611.500 MHz.

There are 3 VCO's. VCO 3 drives the 2nd mixer, converting the 600 MHz down
to 48.5 MHz.
VCO 1 or 2 (depending on frequency being listened to) drives the double
balanced mixer to generate the first IF from the incoming signal.

You can order the service manual for the radio from:
Tandy Electronics
National Parts Div.
900 E. Northside Dr.
Fort Worth, Tx. 76102 USA.
It contains a brief but good rundown on the theory of operations,
good schematics, PC layout drawings, and lists of part numbers. Spare
parts can be ordered from the Ft. Worth Address.
>From the questions you have, I would recommend that you hook a logic
analyser up to the VCO & PLL control & data lines & see if you can
determine the relationships between frequencies tuned & data sent to the
hardware.
You might also want to examine the Optoelectronics 456 as it takes control
of the radio and must do all that the front panel CPU does.

Please let us know what you find out. Thanks!
-- Chuck

4629. PRO-43 modifications FAQ

Newsgroup: rec.radio.scanner

Radio Shack PRO-43 Modifications FAQ
< Last modified February 27, 1996 >

CONTENTS

1. Introduction
2.* Which units can be modified for extended frequency
reception?
3. Companies that will modify the PRO-43 for extended
frequency reception
4. The modifications
extended receive (original mod + solderless)
keypad beep delete
improved audio
attaching an S-meter
400 memory channels
extended receive (30-68MHz for European model)
------------------------------------------------------------
1. Introduction

As long as there is a continuing demand for it, this mini-FAQ
about PRO-43 modifications will be posted every month or so.
In large part, it is the file PRO43.MOD from
pub/hamradio/mods/tandy at oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (800 MHz:
original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter
(5) extended receive (30-68 MHz for European model)

There is also a mod for 400 memory channels, but, to quote
its author, it is very complicated, should only be attempted
by someone with moderate to advanced electronics experience,
and is not for the faint of heart or the "weekend technician."
A brief description is included at the end of this FAQ. If
the mod were included in its entirety, the size of the FAQ
would be increased four-fold.
------------------------------------------------------------
2. Which units can be modified for extended frequency
(800 MHZ) reception?
```

Note: In the United States, it is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment that can receive or can be modified to receive such communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive?
The best information is that units sold in the US and Canada can be identified by the following scheme

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

There have been rumors that the correspondence between serial number and FCC-ID may not be perfect, that is, there may be some units judged modifiable by the serial number and nonmodifiable by the FCC-ID, and vice-versa. Anyone with a such a unit should send a message to gdallal@world.std.com so that the information can be incorporated into this FAQ.

Date codes: Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994). There have been *no* reports of a modifiable US 3A4 unit. However, there have been reports of a modifiable Canadian 10A4 unit; it did not have an A in the serial number.

Until the rumors surrounding imperfect correspondence between serial number and FCC-ID can be settled, it is better to check the FCC-ID. But be careful. All units have A's in the FCC-ID. Only nonmodifiable units have an FCC-ID that ends in A.

THE PRESENCE OR ABSENCE OF A FINAL 'A' IN THE FCC-ID
IS A DEFINITIVE WAY OF DETERMINING WHETHER A PRO-43
CAN BE MODIFIED FOR EXTENDED FREQUENCY RECEPTION.
IF THE FCC-ID IS 'AA020-300', THE UNIT IS MODIFIABLE.
IF THE FCC-ID IS 'AA020-300A', THE UNIT IS NOT MODIFIABLE.

It has been reported that some units currently being made for sale overseas can be modified for extended 800 MHz reception. However, it is not known whether this applies to all overseas units or, if not, whether there is a way to distinguish modifiable units from nonmodifiable units.

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a changeover or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the extended receive modification is worthwhile. According to Bob Parnass, from his "Improved Audio Mod", below:

"Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it. On the other hand, quoting ray_reese@tscnet.eskimo.com (Ray Reese),

When I purchased my PRO-43 and did the mod for adding 54-88 Mhz, using the removed cell. diode, I wanted to be able to listen to the sound carrier for the tv channels 2-6 as well as the 72-76 Mhz band. It is worth the trouble to make the mode and it does work well in my area, despite not having the correct coils for that band area. Do the mod anyway, but [if you've trashed your original diode], use a 1N4148 fast-switching diode. Perhaps a 1N914 might do the job also. They can be found at Radio Shack for a cheap price.

---

3. Companies that will modify the PRO-43 for extended

frequency reception

If you'd rather not do the modification for extended frequency reception yourself, Cellular Security Group, 106 Western Avenue, Essex, MA 01929 (508/768-7486) will do it for $40, which includes insured UPS return postage. However, CSG will not move the diode to extend the low band to 88 MHz; they only remove the diode to unlock the 800 MHz frequencies. When CSG is mentioned on the net, two types of comments follow: testimonials from satisfied customers and comments from those with the technical skills claiming that the service seems high priced for just removing the diode. But, there have been *no* reports of shoddy work or damaged radios. (They've modified two of mine.) Units are processed within 24 hours of receipt.

Grove Enterprises' newly advertised Repair Service will perform the mod for $40 plus shipping. They will move (rather than just remove) the diode in units that can benefit from it, but state that there is no way to tell whether the diode should be moved without looking inside. They claim that the determination can not be made from the serial number, FCC-ID, or date of manufacture. For further details, call Grove at 704/837-7081. In order to get a unit modified, a service order number must be obtained from the same telephone number. Packages without a SO# will be refused.

---

4. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them. They are selling the PRO-43 for $300 which is $50 less than Radio Shack. I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

From: IN%"savage@dg-rtp.dg.com" 2-FEB-1995 17:55:07.31

BTW, I did something similar [to the mod that follows] but MUCH easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the batteries usually lie. You'll see the diodes there. Simply take an xacto knife and and break the solder on the D4 diode (left-most on mine) on the side facing you. I just cut back-and-forth for a bit. Once the solder (it's surface mounted) is weak enough, I just bend up the diode a bit from the PCB. Presto. I left mine hanging on the one side with solder. If you continue to work it a bit, you can probably remove the whole diode.

--Ed

From: springel@umich.edu (Jason G. Springel)
Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading many of the praises for the Pro-43 on this newsgroup. I decided to try and MOD it, but don't have a lot of experience with a soldering iron. After examining the scanner's innards, I found it was quite easy to "fix" with nothing more than a minature philips screwdriver and some small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of
microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and
other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by
four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit),
remove the two screws from the lower circuit board. Looking down at
the unit, you will see that the screw on right side of the lower
circuit board can be easily removed. Remove the screw on the left side
by by sliding the screwdriver between the top circuit board and the
metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel
(antenna, volume, and squelch knobs) along with the top two circuit
boards as one unit. The two circuit boards will be connected to the
final circuit board (the one attached to the front section of the
scanner) by several wires. Simply set the top panel/circuit boards
alongside the front section of the scanner and you can leave these
wires connected.

Step 5

The microporcessor is located under the large metal shield on the final
board (the front section of the scanner with the display and keypad).
If you look under metal shield from the side closest to the bottom of
the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to
remove it completely (unless you want to use it to restore additional
frequencies as explained in other MODs), you can just lift one side so
it dosen't make connection and then put a small piece of tape or heat
shrink over it, so it won't. Make sure it's not lifted to high or the

boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD! Hope this helps those of you who do not own a soldering iron!

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

---

1. See "PRO-43 Product Review," by Bob Parnass, AJ9S, in the November 1992 RCMA Journal.

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

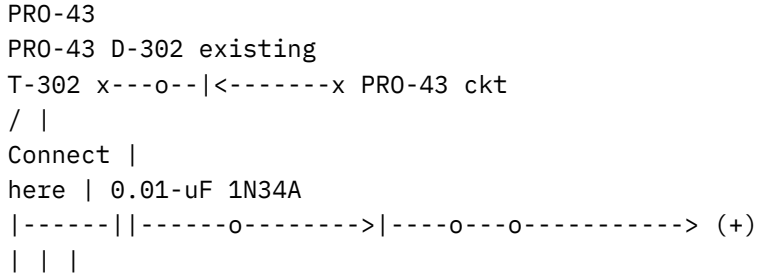
Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



PRO-43
PRO-43 D-302 existing
T-302 x---o--|<-------x PRO-43 ckt
/ |
Connect |
here | 0.01-uF 1N34A
|------||------o-------->|----o---o-----------> (+)
| | |
| \ | To the
| 47-k / | S-Meter of
| ohms \ = 0.01-uF Your Choice
| / | (This should
| 1N34A | | be a jack
|-----|<-------o---o----------> (-) mounted on
^ PRO-43 Ground^ the case of
Legend: the scanner.
|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|
2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode
3. o means a connection, preferably soldered
4. The 47-k resistor is self-explanatory, I hope.
5. -------- and | are wires/conductors.
|
|
6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

```
5-k Trim Pot
(+) --------/\/\/\/\---o--------|
| | |
This should |-------| |
be a plug of +
some sort to The S-Meter
connect to the Terminals
mating jack on -
the scanner |
|
(-)----------------------------|
```

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Developed & distributed by: Bill Cheek
COMMtronics Engineering
PO Box 262478
San Diego, CA 92196-2478

Ok to distribute, but credit appreciated. Thanks!

Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)

+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

OK, I stand corrected, in MOST (Many?) states that have scanner laws of various types, you are going to be OK if you have a valid amateur radio license. Granted, maybe not in ALL such states, but in MOST of them!

I believe that the Uniden BC9000 has built-in CTCSS decode, but I could be wrong. One of my friends just bought one, you could contact Chuck on America Online at CR7CELL1.

Other than that, there is an add-on tone decoder for the Uniden BC760XLT, but I don't believe there are any other scanners on the market that can decode tone.

>>

I like the 2037 despite it's lack of high end features. I've used mine as a mobile rig using the Radio Shack DC adapter (#270-1533) that plugs into the cigarette lighter.
However, I'd be remiss if I did not mention that the LCD display does not tolerate freezing temperatures. I hear it can get cold in Canada. ;)

I still have an old radio shack portable 4ch crystal scanner. Its not as
good as my Pro43 but it still works! Covers air/vhf bands so its good for
things that done change frequency often like local airport towers,
weather, etc. There are still lots of these kicking around but with rsh
and uniden selling simple synthsized scanners for a low as 100$, its hard
to _give_ these crystal scanners away. I know 'cause I tried to sell mine
a few months back and got NO responses at all :)

4640. PRO-2035 RX sensitivity?

Newsgroup: rec.radio.scanner
Date: 1996-02-28 00:00:00 UTC
From: kwon2m@aol.com
Message-ID: <4h0p64$fuc@newsbf02.news.aol.com>
Source record: 239132

Has anyone done sensitivity measurements on a Radio Shack PRO-2035? I own one of these units and have found it, in comparison to other scanners I own (
PRO-43, BC300, BC210XLT, and others) to be pretty deaf on VHF-HI (144 - 175mhz). This prompted me to do some sensitivity measurements. Using an IFR1600CSA service monitor ($35000 price tag, recently cal'd), I found that
the 2035 measured around .2 - .25uv for 12db SINAD over most of its frequency
ranges (up to 1000mhz). This is excellent performance and exactly what I would expect from a receiver of this caliber (and price). On VHF-HI, however,
I measured only about .6 - .7uv for 12db SINAD. This is, in my opinion, TERRIBLE performance! I haven't seen a monitor receiver since the old "tunable" days that had sensitivity this poor. For comparison, I also checked
my PRO-43 - .15uv over most of its ranges, and BC300 - .2uv on VHF-LO and HI,
.35 on UHF. I took the 2035 back to Radio Shack for warranty service ("You have questions, but we don't understand them"). They sent my rig out, but it
came back "no problem found". I repeated my tests, with the same results. Scanner specs have always been very conservative and the 2035's are no exception. This pretty much gives RS an out, as the machine meets their specs. It doesn't leave me a happy customer, however. I guess the bottom line
is this - should I expect more from my 2035, or is this sensitivity typical
on VHF-HI? Any comments would be much appreciated. Please email to KWON2M@AOL.COM. Thanks.

4641. SW Frequencies for ConEd, LILCO

Hi everyone,

I was going through some of my scanner frequency lists when I came upon the following freqs. listed for Consolidated Edison, and Long Island Lighting.
2194, 3155, 4438, 5005, 6765, and 7300 KHz....
Could someone let me know what these are used for? Are they for digital transmission or are they part of some nationwide utility network? In any case, I guess they are truly "utility utility frequencies"!

Thanks,
Jeff Chambers
Long Island, NY

Source record: 239139
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Well, I have an AR2700 which is similar to the AR8000 with only 500 channels (and other differences) and have used ProComm to "talk" to it.
Each command consists of 2 letters followed by zero or more parameters. The command set for the AR2700 is similar to the AR8000 (they share many of the same commands) although many of the 8000 commands are not implemented since the 2700 lacks the features.
You can also use the Windows Terminal program (if you are into self abuse) to talk to it. Just set any terminal program up for 9600 baud, 8 data bits, 1 stop bit, no parity and you're in business.
Let me know how it goes.

(ex motorola trunking tech) Not neccesarily the lowest four
channels, but usually. Each time the system goes through a RESET, the
control channel will change to the next sequential channel. The
system automatically resets every night at midnight. A reset can also
occur after a power outage or the system operator can reset by modem
or locally. Some simulcast and other special systems may have less
than 4 control channels. Usually 1 or 2.

Huh? VHF/UHF bounces around big time. That's one of the fun things about
fox hunts and bouncing signals off water towers, buildings, etc. Sometimes
polarization is a big deal, especially in theory but in practical terms, I
haven't found it to be *that* big a deal, especially if it would take
considerable effort to re-mount the TV antenna.

>> Even for transmitting, the
>>75/50 ohm mismatch is acceptable at low power levels.

>I suppose, especially if you don't want to get any signal out. The lower the

Again, I speak from experience. I used to run 5 watts out of a R/S discone
with RG6 cable. Had real good luck with it and the mismatch only slightly
increased the SWR. Besides, radios these days are designed to take
considerable mismatches. What do you think those "rubber ducks" look like
to a transceiver?

While were on the topic of Radio Shack, I just bought a Pro 2026 and overall I am impressed with the product. I know this is an exception to all of the bad things that go on at Radio Shack, but the sales person who sold me the scanner rates a 7 in my book. Why so high? I needed to covert the scanner to that I could use a plug-in lighter adatper so that I can take the scanner out of my car at night when I'm not using it. I would of rated him higher but when I went back to ask a question about why the scanner didn't hold numbers in memory after I took it out, he didn't have an answer to that question. The first thing I asked when I bought the darn thing was will it hold them in memory if the power is disconnected? The book says it will hold them for 14 days, but so far nothing. Maybe there is a defect in the one I bought? If anyone has any answers to this question please feel free to email me with an answer. Thanks!

>....What do you use the Opti Scout for?....

The Scout is a frequency counter. That is, it will display the frequency of a nearby transmitter, simply by picking up the airborne transmission. The Scout, however, also has the ability to immediately and automatically program the frequency into compatible scanners. Thus, if you see someone trasmitting on a portable radio, for example, you can immediately listen in.

>You run 9600 baud over HF? Wow. I'm impressed. You must be the EE of all >EEs.

It doesn't take an EE to run 9600 bps on HF -- just somebody with a wideband transmitter and a willingness to break the rules. :-)

(Actually, things might get interesting if hams are able to start using advanced digital modulation modes in the next few years. Zenith's 8-VSB system can transmit 19.3 Mbps in a 6 MHz TV channel with room to spare, and there's a project going on to transmit compressed digital audio -- using 96-128 kbps of data -- in the AM broadcast band *under* regular AM broadcasts, so a station can run AM and digital stereo on the same frequency through the same rig!)

I am searching for a web site or other source for "undocumented features"
for various scanners (i.e. memory reset, battery voltage, etc...).
I'm in need of these features for a number of different units. If anyone
knows of a source for this, please e-mail me and let me know.

Thanks in advance,
DOUG

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and
larger book stores for under $13. Police Call is basically
a computer printout of FCC license information in the fire,
police, local government, and conservation services in two
lists: by licensee name within state, and by frequency.
Later editions have included a few pages of local airport
and nonsensitive federal government frequencies. The 1996
edition contains selected business frequencies, too, but
callsigns are listed only for local government and public
safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local

agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information

fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 50 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s]

missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Abstract

This article contains product review summaries for more
than 60 old and new scanner radios and monitor receivers.
Other topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor |
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be
complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had
sellers look me square in the eye and tell me their radio

worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. | Grove Enterprises (Brasstown, NC) and Radio Shack repair | scanners, and Uniden can repair newer Bearcat models but | often refuses to service older models. G & G | Communications (telephone 716-768-8151) is a family owned | company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making

scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews of these recent scanner models in Monitoring Times magazine:

Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042

Note: Reprints of Monitoring Times articles are available for $2.00 each from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's

a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in

binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light

panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner

unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in | Monitoring Times, April 1995 and "The Radio Shack PRO-26 | vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in | Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The

most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced

with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size.

Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a

transmission.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob | Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1985 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat | BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, | August 1995.

PRO-62: 1984 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band

reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by

Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different | crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Cystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

"David J. Sampson" <DSamp@ix.netcom.com> wrote:

>If I split the feed for my TV system in my house between the TV antenna
>and the scanner antenna, will this work effectively?

I was wondering a few things about better reception for my scanners in the 46-49mh range. First, I live in an apartment, so having a big antenna on the roof isn't an option and I'm wondering what a good substitute would be. For the past couple years I've just been using the Cable TV jack (I don't subscribe to Cable TV so I figure the longer cabling is better than the standard antenna that most scanners come with.)

Secondly, a couple of my scanners that are close to my PC always get some type of interference in the 46-49 range which is basically the only range I care about. It seems like the monitor gives off the most interference and I'd like to know a better way to get rid of it, besides moving the scanner or shutting the PC off since most of the time I'm on the net, etc I also like to be monitoring the scanner.

One last thing, For DTMF decoders I was wondering what the best and most reliable are. I'm not inclined to build one myself so for now I just go with Motrons version for $99. I know they probably can be gotten cheaper but I haven't had the chance to check any electronics catalogs lately and was just wondering what the cheapest decoders from other companies were priced at.

Thanks.

-Mark

4673. Home-made Discone Antenna

Newsgroup: rec.radio.scanner
Date: 1996-02-29 00:00:00 UTC
From: joolson@ccgate.dp.beckman.com
Message-ID: <4h4mdh$cgm@inet.dp.beckman.com>
Source record: 239016

I received the below instructions from John Mace to build a Discone antenna. It is a "great" improvement over the Duckie antenna (on PRO51). I have no problem receiving the PD (453.xxx) from a town 30 miles away and the CHP at 42.xx is greatly improved also.

I am using 25' of RG6 (75ohm, but reportedly less loss than RG8). It is hanging from the inside rafters of my garage. Haven't tried RG8 yet to see if impedence really matters when receiving only. I also made mine for 80-mhz to 800-mhz to get closer to 42.xx mhz, which is where the Calif Highway Patrol operates. I purchased 30 ft of 12 ga plastic coated copper wire (just peel off the plastic) from the hardware store and I came up just a little too short for exactly 80-mhz. If you build one much larger than this, you may want to try 10 ga wire so the disc elements won't sag.

I also used a 3/4" threaded PVC coupler instead of a cap. The open coupler allows me access to the disc junction from the top for experimenting with a verticle element in the future. It was very cramped when soldering, so a 1" coupler may work better. If you use 10ga wire, then definitely use the 1" PVC. When finished, just install a cap to seal up the top. Also, you'll need something hotter than a standard soldering iron to solder the cross sections of the 12 ga wire.

The angle of the cone doesn't seem to be overly critical and I didn't join the tips of the cone or disc with wire (yet). Haven't tried adding a vertical yet either.

If you have any additions, test results, or another type of home-made antenna, please post a follow-up.

Good Luck
Jim Olson

>Author: John Mace <jwmace@hiline.net> at INTERNET

>This is a good listening antenna and there is a lot of room for experimenting.
>My information comes mainly from the ARRL Antenna Book (a good antenna
>resource) and just "foolin around". The antenna consists of two parts, as
>you know..The disk on top and the cone on the bottom. At vhf & higher
>frequencies the gap between the cone & disc is small..say 1/4". This gap is
>not critical at all for listening but I would imagine it becomes more
>critical for transmitting. Also, proper design calls for a narrow opening at
>the top of the cone but again at these frequencies and for just listening
>there's not any noticeable effect and construction is much easier to omit
>it..so here we go. If you use a 1" or so pvc cap you wind up with a really
>sturdy antenna. The disc consists of 3 solid copper wires passing

>horizontally through the top of the pvc cap (drill small holes first).
>Center all 3 wires so that you now have "six wires" sticking out equally
>around the cap. The feed line to the receiver is 50-ohm coax (not cable tv
>cable, this is 75-ohms and will degrade performance). Radio shack sells
>50-ohm coax by the foot and its relatively cheap. Solder the center lead of
>the coax and the three horizonatal wires at the point they all meet under
>the cap. Make sure there is no enamel or other insulation on your wires at
>the solder point...half done.
>>
>Now 1/4" below the solder point drill and pass the 3 long wires through and
>equally around the cap, this will be the cone. Solder the shield of the coax
>and these three wires together at the point under the cap where they cross
>each other..be sure the cone and disc are not touching or no stray shield
>wire or solder is touching the disc. To really make it sturdy you can fill
>the cap up with hot glue or silcone sealant, etc. This will keep your solder
>joints from flexing and breaking. Bend the "6" cone wires down to about a
>60-degree angle from the bottom.. It's ready to go but if you want to
>improve its shape holding and performance solder a cirle of wire around the
>tips of both the disc & cone..a lot of trouble but worth it.
>
>Now for dimensions: the minimum frequency of the antenna is 2834 divided by
>the length of the cone wire in inches. The maximum frequency is approx. 10
>times the minimum. So, to receive 90-mhz to 900-mhz +- the cone length is
>31.5" (each leg..that makes the total length of each cone wire 63" before
>going through the cap) and the disc width total is .7*leg length or 22.05".
>That's all there is to it. Have fun experimenting such as adding length to
>the disc and turning the ends up, adding a vertical, etc. I have my antenna

4674. Whats In A Rubber Duckie???

Newsgroup: rec.radio.scanner
Date: 1996-02-29 00:00:00 UTC
From: joolson@ccgate.dp.beckman.com
Message-ID: <4h4n58$crj@inet.dp.beckman.com>
Source record: 239017

I can't disassemble my duckie antenna to see how its constructed.
What makes it a such a wide band antenna, multiple internal
1/4 wave coils?

I tried a center loaded mag mount CB antenna and as expected
there was increased reception above 400 mhz and decreased below.
Any suggestions to make it into a wide band.

Thanks
Jim Olson

As a member of the four person (off duty hours only) "volunteer" LAFD Web staff, I thank you for your input. As you can imagine, the site takes a great deal of effort at maintaining. We just succeeded in getting the URL shortened from "department" to "dept". Up until now, the folks at the City's ITA who have overall admin authority over our server have insisted that all of the agencies have their title in CAPS. We are already working at addressing your concern, but it may be a while.

>Also, there seems to be a problem when displaying the list
>of fire stations, at least when using Netcom's Netcruiser.
>Perhaps you could ask your webmaster to take a look at this.

Will do. Yours is the first complaint I have fielded.

>Thanks for being so open with information about the LAFD.
>I wish that your counterparts in the LAPD were like this.

Alan, we certainly wish to remain open..but are keeping a cautious eye towards what might develop. We feel quite strongly about maintaining the "spirit of the Web". As for the PD....well, some lead - some follow! <grin>

[VENT MODE ON]

Unfortunately, there has already been some abuse by patch collectors and others who have inquired about "ride-alongs" etc. They have used our posted Fire Station Business phone numbers to call at all hours. FYI (as our web page explains), both of those requests are handled by mail only, and *cannot* be facilitated by a phone call to a Station. Despite the rules regarding Fire Station Business Phone use clearly posted at the Website, one volunteer Firefighter from Georgia wanted to create a "buddy system" where members of his Department could call our Stations anytime

they needed advice - and he had already distributed a list to his co-workers. WRONG!

Sadly, IF SUCH PROBLEMS CONTINUE, WE MAY SEVERELY CURTAIL POSTING SUCH INFORMATION. There is simply no way for the leanest Fire Department in the nation to be abused by folks here on the Internet. Help is one thing - abuse is another!

[VENT MODE OFF]

Alan, thanks for writing. I hope to see you on Saturday, May 11th, when all 103 Los Angeles City Fire Stations will be having open house from 10:00 - 16:00.

Please contact me whenever I can be of assistance.

Brian Humphrey

I've had my base scanner hooked up to a 43 element v/u tv antenna mounted sideways with a Channel Master TV amp for about two years now, ever since I broke down and hooked up to cable, and it works great! If you can't find a Channel Master amp, just about any broadband RF tv amp like the ones at Radio Shack will boost the desired signals. Just make sure you turn the fm trap OFF!! Also, this setup is directional, so a rotor really makes it hum, and can avoid intermod if you happen to live under a big hill with a lot of towers like I do.

Source record: 239021

I use a 43 element tv antenna w/ my scanner, hooked through a Channel Master 0064 pre-amp and it works great!! I did turn the antenna on it's side, and mounted it back to the mast this way to acheive vertical polarization, but found not a lot of difference. If you want to try to see how much difference the polarization makes, just try listening to your scanner on it's side. In most urban areas you will notice little difference.
If you do use a TV preamp, and live in a strong signal area, intermod could be a problem if a non directional antenna is used, also, don't forget to turn the FM trap off.

Well just for giggles i tried the tv antenna and it works like a champ. I am now able to hear the local police on the input side of the repeater, and since they occasionally go simplex, it picks that up also. I have no degraded loss of signal at the tv either, so for my case an existing tv antenna works just fine. Would like to hear from others and their experience.

Does anyone know how I can find out what the best scanner to buy is that I can modify to listen to cellular telephone calls with? Please let me know where I can find out how to modify radios, and which one to get. Thanks for e-mailing me.

>

The main point here is that Using your TV antenna will dramatically
improve reception over the simple rubber ducky. The db gain in the TV
directional antenna makes up for the db loss by cross polarization.

4686. FS: AOR AR-2002 scanner in mint condition

Newsgroup: rec.radio.scanner

I have for sale a mint condition AOR AR-2002 scanner, covering 25-550 MHz and 800-1300 MHz. Boxed, complete with UK mains PSU, telescopic whip, and manual.

Offer by personal e-mail please. I have a firm offer of 120ukp from a dealer already, (a rock-bottom price), by the way.

Check out the Opto Cub. It is a more intelligent counter that can better
distinguish between noise and actual signals. It is the same as the
scout without the memories and computer interface.

Manuals and replacement parts for all Tandy products can be ordered from:

Tandy National Parts
900 E. Northside Dr.
Fort Worth TX 76102
(800) 442-2425
(817) 870-5600

Give them the catalog number (20-144 for the Pro-2005) for the product and ask for the Service Manual ($8). They take plastic, deliver promptly, and are the best run division in Tandy (which may be damning with faint praise).

I see many mods for the PRO-200? group of scanners and would like to install a computer interface to my PRO-2030. I suspect that there are many simularities, but I haven't heard of many.

I took a chance one evening by cutting a wire loop to enable the cellular band, and it worked. This after I read similar mods for PRO-2002/3/4, but before seeing anything for the PRO-2030.

Are the PRO-2002/3/4 scanners similar enough to the 2030 to make it practical? Or weren't there enough 2030's sold to stimulate much interest?

4693. Digital & SS Radio Basics for Scanners

Newsgroup: rec.radio.scanner
Date: 1996-02-29 00:00:00 UTC
From: Dan Prysby <prys@msg.ti.com>
Message-ID: <4h55nb$4no@tilde.csc.ti.com>
Source record: 239036

Some basic digital/spread spectrum info:

In a simple sense:
With cordless phones or any radio transmission there are presently
2 common ways to carry the voice:
1. Analog modulation using direct AM or FM from the voice signal.
Bandwidth of channel is narrow, say 30kHz like cordless 49MHz
or celluar AMPS.
2. Digital modulation which sends bits representing small samples
of the voice signal and uses complex QPSK or similar modulation
schemes - still narrow band, say 30kHz like some 900MHz
cordless or cellular TDMA.

If using method 2, there is also the ability to further encrypt the
signal with a "wideband" digital modulation stream.
Bandwidth of channel is wide, say 1.25MHz thus "spread spectrum".
This is like some 900MHz cordless or cellular CDMA.

Scanners are meant to receive modulation via method 1.
A standard AM/FM receiver like a scanner will never decode any
digital information from method 2; all you hear is a buzzing sound.
Even the buzzing does not represent any transmitted bits as the
scanner does a simple linear frequency demodulation but the bits
are in a complex amplitude and phase constellation scheme.
Further encryption for spread spectrum puts the energy in a very wide
band - the scanner will receive very little energy in the 30kHz and
it FM demodulates a weak buzzing signal.
Keep in mind that the digital encoding of a signal for radio
transmission is a complex encryption of the bits and usually includes
error correction bits and interleaving codes that are unique to any
given system.

It's fun to try and recieve these digital signals on a scanner
but buzzing is about all you'll get.

This is about as deep as I thought you'd want.

4694. Freqs. used by crews at movie locations wanted

Newsgroup: rec.radio.scanner
Date: 1996-02-29 00:00:00 UTC
From: alanoue@shrsys.hslc.org
Message-ID: <29FEB96.20015478@shrsys.hslc.org>
Source record: 239037

There is a crew in my town this week filming an outdoor location scene
for a movie starring Brad Pitt & Harrison Ford. I'm trying to figure out
which frequencies they use. I was over there today briefly with some regular
business & itinerant freqs. plugged into my Pro 43, but no luck. I also
tried searching through these frequency areas, but still no luck. I know that
the motion picture industry is alloted certain special frequencies, but what
are they? I do not currently own a counter, which would have been helpful.
Incidently, I was'nt on the scene five min. before some smartass spots my
radio and marches up to me demanding to know what I'm listening to. Of course
he KNEW what I was listening to (or at least trying to listen to). Plus, tons
of cell phones all over...
Anyway, help would be greatly appreciated with this.
Thanks,
Phil

Roland,

The Uniden Bearcat BC-9000 has this option. You would need to buy an optional CTCSS decoder chip and install it. I have a BC-8500 (former model) and have the CTCSS chip installed.

The unit works fine with the chip. Installation is fairly easy, but you have to wbe careful with the IC's pins. The 9000 should be better, since it is an improvement over the 8500.

You can get a 9000 for around $380.00 via mail order. I use Grove in N.C.
The CTCSS tone board is additional. Not sure of the price but

Grove's url is www.grove.net

Well, I am looking for a low cost alternative to an Amateur Radio HT.
When you look at the cost of these scanners (new ones at least) in the
catalogs, they come up to about $300+. For that money, it would be
better for me just to go out and buy a new HT that I could use on the
ham bands.

Hi,

I would like to know what the signalling for pocket pagers is. I can tune into a local pager frequency with my 2m handheld and get modem tones of some sort. If somebody what the modem set is (Bell 202 or whatever) please let me know. If you know the part number of a chip that will do the demodulation I would appreciate knowing that too.

Thanks in advance,
Dave.

I have found that the small earphones that Radio Shack sells work quite nicely. They stay in the ear very well and you can still hear things around you. It is discreet enough to listen to your scanner through when a plane is landing (...at this time we ask you to turn off all electronics...), so that the flight attendants don't see it (as long as you have a window seat with something you can lean your head on to hide the wiring).

Overall, they are very good earphones. Very inexpensive, too.

Message-ID: <31367308.13168916@nntp.ix.netcom.com>
Source record: 238895

A couple months ago the local PD changed their primary channel (Channel One) to a new frequency. They changed the old primary channel to now be Channel Five. They also picked up what I thought was a new channel, Six. But I could never find Channel Six.

I have the Radio Shack telescoping antenna and saw here the trick about fully extended except for the one just above the "bump" in the middle (sorry, I forgot what it is called). After doing this, I happened to hear someone say they were on Channel Six. After playing around with the squelch I found that sometimes I can pick up one or both sides of a Channel Six conversation.

Forgive me for asking the probably obvious, but is the repeater smart enough to repeat one channel and not the other, even though they are on the same frequency?

J.R. Pitts

Before anybody tells me starts rippin' on me, I have only looked at one place for a scanner. Radio Shack. I've been reading this group for a couple of weeks and can't figure out which is the best scanner to get. It seems like the debate is as old as Ford:Chevy, Coke:Pepsi

The two scanner's I looked at where the low end $125 basic 800 mhz scanner, with 16 chanels. Then for $450 and 200 chanels, I could scan all the way up to 1.3 Ghz. But I don't know what's up there that would be worth the extra money.

I'm also interested in a scanner that I can connect to my PC. And neither of these scanners did that. So if someone could point me in a direction, I would appriciate it.

>Is this 'accepted practice' at RS, or just that particular store I went
>to?

Substitutions are generally an accepted practice, at least it was when
I was working. My former boss encouraged this, as selling a scanner for a
reduced price is better than not making a sale because you are out of the
sale item. Of course this is ONLY if you are really out of stock on the one
on sale. The one difference I see is the method by which the new sale price
was computed. I think you got a real good deal. The way I think it probably
should have gone on something in that price range is that you reduce the price
by the same raw sum of the discount. ie, 449.99 - 120.00 = 329.99.
Either way, I think you will be hard pressed to find a Pro-26 on sale
in a flyer for $281. You got a good deal. Enjoy it.

: broadcasts, so a station can run AM and digital stereo on the same frequency
: through the same rig!)

Can someone comment a little more? I mean there's the old Shannon's law
about bit rate=K * bandwidth * log (SNR). Somehow, I have a real hard
time imagining digital stereo UNDER an AM broadcast.

Are they, perhaps, using spread spectrum and taking up a more of
the band than just the one station. Perhaps all the bandwidth between
the station and its nearest neighbor on the dial in that locale. In a way
that won't interfere with faraway station in that band?

Adam I have a Sportcat 150 and I like it. It doesn't pick up the actual
cell phone freq's but you can pick up what are called cell images these
come in clear and you have no problem listening if that is what your into.
I am happy with it, it is a nice little scanner and the price for me
at least was right. hope this helps if you have any more questions you
can e-mail me or post it here. John

Not true. Most services on the UHF/VHF frequencies use vertical
polarization. Bounce and reflection make polarization not so critical
on the SHORTWAVE frequencies, but on the VHF/UHF "scanner" frequencies
it still important. The signal reduction for wrong polarization is
in the range of 20 db or so.

Try this test. Use your handheld scanner (with the antenna vertical)
to tune in a weak to moderate signal. Then turn it "sideways"...
most likely, the signal will totally disappear.

Although a TV antenna can work very well as a scanner antenna and a
horizontally polarized TV antenna may be better than a "rubber duck"
(a tribute to how poor the "duck" really is), the TV antenna will
work MUCH better if you possible can reorient it vertically.

Yes, I found out that my Pro-51 has the images 21.6 Mhz below the actual
signal. It's a channel I've been listening to, also! <slap slap>

Police Call is invaluable. Anything better? :)

Thanks, Bradley

>Thanks!
Depending on when your scanner was manufactured, pressing L/OUT, 2 and
9 while turning on your scanner will unlock 66-88 MHz and the cellular
base-to-mobile bands (869-894 MHz). WARNING: This mod will erase all
your programmed frequencies, so write them down first. On a Radio
Shack Pro-46 and Pro-51 channels 14-16 contain 66-88 Mhz frequencies
and channel 23 contains 888.960, which is in the cellular
base-to-mobile band. Use the up/down search arrows to find frequencies
in these bands, and when you find one you want to keep press MONI and
program it into a channel number directly from the MONITOR bank.
This mod has been known to work on Pro-25's, 23's(?), 46's, and
51's.
Another test mode on a Pro-51 is to press 2,9, BAND (or MONI)
while turning on the scanner. This turns on every digit and symbol in
the display in a scan from left to right and does not affect stored
frequencies. Press any key to exit this mode.
And finally, to erase all your stored frequencies you can press 2
and 9 while turning on your scanner.
I think there are more test modes but none of them unlock
blocked-out frequencies and I can't remember them right now.

Price is now $450.00 US plus shipping.

The MVT 8000 is 200 channel ac/dc scanner with a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired.

It covers 8 Mhz to 1300 Mhz (continuous without blockage) and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz.

It's got a 10 band search function, pass memory function, and other goodies found in high-end
scanners.

Kinda interested in freqs between 800-900 with no gaps, right? There is a scheme called the "virtual downconverter" where you send the unit in and for $99 they add a switch and a few wires. When you throw the switch, you tune to some other band and the 800Mhz stuff gets picked up down there. The only drawback is that you have to manually enter all the channels you want 30Khz apart. They advertise in Popular Communications. No, I don't work for them. If anyone has instructions on how to do this, please post it here, also does this work for the Pro-2042 which is replacing the 2035.

: scanners' AM demodulator.

Of course, this process is not linear. As you move away from the center frequency, the amplitude is not going to smoothly drop off in a straight line. The net result will be a LOT of distortion. However, the distortion might be less than than using an FM demodulator with an incorrect bandwidth.

4726. Pro-26 Keypad Secrets

Can somebody please post all the keypad codes (e.g., 2,9,??
on poweron) for the Radio Shack Pro-26 scanner? I bought one recently
and found that 2,9,MON enters some 'test frequencies' into
the first few channels. I was wondering if there are any other
know powerup modes (i.e, Button-A,Button-B,Button-C on poweron, etc).

The Pro-51 model has some test-modes on powerup that enter some
'test freqs' into some channels, and some of these test freqs
(perhaps depending on the firmware revision) are out of the
scanner's normal reception range.

BTW, I went to Radio Shack to originally buy a Pro-51 (on sale
recently for $199.99, regulary $319.99), but they were out-of-stock on
them.
The sales person there gave me the "same discount on any other
scanner", so I got a Pro-26 for:

(199.99 / 319.99) * 449.99 = ~$281, the regulary price of the Pro-26 is
$449.99

Is this 'accepted practice' at RS, or just that particular store I went
to?

Everyone,

I attended a Non Ionizing Radation Semminar and I extracted this informaton
for your reading pleasure.

How is RF energy absorbed into the body?

Factors involved in determining how RF energy is absorbed into the body such as:
1. Dielectric Composition
2. Size of the body
3. Shape and orientation of the body and polarization of the field
4. Complexity (near field) of the RF field.

The human resonance region is from 30MHz to 300MHz

In instances where the size of the body is less than the wavelength, there is little absorption and a uniform or equal, distribution of energy. In this range, the body becomes increasingly conductive as frequency is decreased.

When the wavelength is roughly equal to the size of the body there is the highest absorption with unequal distribution of the energy. Consequently, "hot spots" may be generated.

When the wavelength is less than the size of the body there is lower absorption and the heating is confined to the irradiated area.

Specific Absorption Rate (SAR) is the basis of most safety standards. It is the rate of energy absorption per unit of body mass. At an absorption level of 4 watts/Kg reversible behaviroal disruption has been noted. Levels above 5watts/Kg have resulted in permanent adverse effects. Therefore, most standards have been based on SAR's of 0.4watts/KG to conservatively limit exosures to 1/10th of these levels to account for biological uncertainty and to add an additional safety factor.

The guns used by the police are instant on. The operator has to use the trigger on the gun to transmit. The power levels are in the order between 10 and 100 milliwatts. At frequencies in the tens of GHz. Well above the human body SAR.

Think about all those 25w radio transcievers that have their antenna mounted on a body panel with the tip of the antenna at head level. Take a radaition field strength meter and survey where the driver sits. This is more of a concern that their low power radar guns. The antenna should be mounted on the roof for safety as well as good omnidirectional radation pattern.

I know this is off topic for the scanner group but I am just contributing to an on going discussion. I have changed the subject line to reflect this. If you have no interest then don't download or read and delete. If anyone has any further questions I would happily respond off the group.

I think the problem rests, not with the radar guns themselves, but
with their use. It seems than many officers were trained to keep the
radar gun on continuously, and to rest them on a thigh with the
gunnplexor pointed down, to "hide" the signal from people with radar
detectors. I have no doubt that after many months or years of this
type of exposure, cancer could develop. Keep the radar gun away from
the operator and only "pulse" the unit when clocking a vehicle.
Problem Solved.

There was a story in the news not too long ago about a study of a group of Highway Patrol officers in the US that all developed testicular (sp?) cancer and it was traced to years of operating hand held radar guns. The officers in question regularly (over a period of many years) had all done speed enforcement and often rested the (handheld type) radar guns in their laps between targeting oncomming cars. I believe these units are no longer in use or now have gun link "triggers" so they do not transmit all the time, but are capable of " instant on" operation. Also serves to defeat the use of radar detectors since the guns dont transmit untill its too late...Ever wonder about all those officer/firemen/EMT who use portable radios on their belts and a speaker mic day after day...especially now that alot of them are at 800Mhz? The antenna is right against your back or side. I'm sure there has to be an organ near there thats sensitive to this!

What you have just described is immediate heating from an RF field. Older
radar guns leaked a lot more than today's guns. Microwave frequencies
don't resonate at the same level as the body, but still do have effects on
the skin.

4732. PRO-51 {test modes}

Newsgroup: rec.radio.scanner
Date: 1996-03-01 00:00:00 UTC
From: Marty <nissen@nrcdec.nrc.state.ne.us>

Radio Shack PRO-51 Test Modes

© Howard Bornstein June 2, 1994.
(Revised 10/10/94)
(Revised 11/4/94)
(Revised 4/11/95)

[This document may be freely distributed for all non- commercial purposes as long as it
is distributed unchanged and complete.]

There is an interesting test mode in the PRO-51 that, combined with the direct search
feature of the scanner, lets you pick up out-of-band frequencies. You will have full
access to the 66-88 Mhz ranges as well as the cellular base range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these comments should be
true for any Uniden-made Radio Shack scanner, such as the PRO-46). I'll describe them
first and then how to take advantage of one of them to get the restricted frequencies.

There are three data test modes. These modes completely destroy any frequencies you had
programmed into your scanner, so it's best to use these techniques before you program
your scanner. If you have already programmed it, you'll have to decide if these new
capabilities are worth reprogramming.

TEST MODE 0. Clear the scanner.

A well-known method of clearing the scanner to all zeros is to hold down the 2 key, the
9 key, and turn on the scanner. All frequencies will be lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840

minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00, 510.00, 54.00, 109.00,
118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnostic mode.

TEST MODE 3. Display Test.

Press 2, 9, BAND or 2, 9, MONI.

This put the display in test mode. Every annunciator and every digit element is turned
on in a scan from the left side of the display to the right. To keep this test mode
continuous, release the buttons before the first scan finishes. This mode does not
affect stored memory. Press any key to exit this display mode.

How to use the test mode frequencies
Now, if you've decided to try test mode 1, you will find several out-of-band frequencies
stored in your memory channels. Channels 14-16 hold frequencies in the blocked-out 66-88
Mhz range, and channel 23 holds a frequency in the blocked-out cellular base range. Once
you have these frequencies stored in a memory channel, the PRO-51's direct search
feature will let you search though these ranges. In the cellular band, the scanner
searches in the correct 30 Khz steps.

You don't have to keep these frequencies in the channels they were stored by the test
mode. You can move them to any channel in the scanner. Here's how.

First move the frequency to a monitor channel:

While on a channel with one of these frequencies, open squelch completely. Press direct
search button, either up or down. The direct search button puts the scanner into search
mode and the open squelch holds the frequency. Then press the Monitor button. The
frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner:

Enter the channel number Press PROG Press MONI Press the number of the monitor channel
if the proper channel is not displayed Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a direct
search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenomenon
concerning TV audio and the PRO-51. Channels 4, 5, and 6 fall within the 66-88 Mhz range
(71.75 Mhz, 81.75 Mhz, and 87.75 Mhz respectively), yet the PRO-51 will not pick up the
audio frequency while searching in this range. However, TV channel 2 audio is at 59.75
Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of the TV
channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, since the
PRO-51 is receiving in narrow FM mode while TV audio requires wide-band FM mode for
proper reception.

These test modes also work on the Uniden-made PRO-46 and PRO-23 Radio Shack scanners.

----------Update Notice----------

Apparently, as a result of this document, and publication of this information elsewhere,
the FCC demanded that Radio Shack pull all existing PRO-51s, PRO-23s, and PRO-46s off
their shelves and were forbidden to continue to sell them. This is particularly
puzzling, since all three of these scanners can receive cellular via images without any
special modes or procedures.

As of the end of October 1994, PRO-51s have started reappearing in Radio Shack stores
(date code of 7A4). These units were apparently shipped to Uniden to have the cellular
frequency that appears in test mode 1 (channel 23) removed. If you follow the procedure
for test mode 1 on the new PRO-51s, you'll instead get the frequencies from test mode 2,
which will not allow you out-of-band reception.

However, Uniden apparently didn't spend much time with this modification because it is
still possible to put the "new" PRO-51s into test mode 1. Here is the procedure:

First initialize test mode 3 (the display test). While the display is being updated,
hold down the 2, 9, and L/Out keys. Keep holding them until the display finishes filling
up. It will stop with all of the test frequencies for test mode 1 loaded in memory!

PRO-51s with a date code of 8A4 (August 1994) will be able to do all the test sequencies
with the exception that channel 23 will not contain a frequency in the cellular range.
The other out-of-band frequencies will still be there.

Jeff:

The Radio Shack PRO-2036 is basically the Uniden BC890-XLT. So any mods you see for the Uniden
should apply. I'll see what I can find.

I would be willing to bet that over ten times the amount of Emergency Traffic has been handled over Citizens Band channel #9 compared to Amateur Radio. Why? Because a lot of everyday folks had CB's in their cars along with State Troopers, Tow Trucks and etc.. My wife who is a 9-1-1 Dispatcher refuses to go to another Hamfest after just attending one. Why? The complete lack of hygiene by a great many of the people in attendence made her want to throw-up! She also noticed a feeling among many there that they had an overblown ego. To this day she won't let me have the mobile on while she is in the car. Why? Too much swearing, keying up on people when they are talking, belching & farting in the mic, people so bored with life that they talk about the glass of orange juice they had at breakfast... Once, she even asked me to turn the CB OFF! To bad it was the ham rig that was ON and not a CB. To say that one service is better than the other is to say that your head is in the sand. Both have good points and both have bad points.

well, since the RS hi-cap cells (aa) are rated at .85ah,
they would certainly be 'better' than a cell rated at
.5ah, regardless of mfgr.

note that 'better' could mean different things, depending
on who you are talking to......

4739. Re: RF radiation and the human body

Newsgroup: rec.radio.scanner
Date: 1996-03-01 00:00:00 UTC
From: boakley@dfw.net
Message-ID: <4h7tfu$t8a@dfw.dfw.net>
Source record: 238989

I tend to disagree with the information you have given us. The size of
the human body is not what is critical here, but the size of the
organs, cavities, and cells would be more correct in determining the
possible effects of resonance of rf and its effects on tissue overall.
Just IMHO. B.

: Everyone,

: I attended a Non Ionizing Radation Semminar and I extracted this informaton
: for your reading pleasure.

: How is RF energy absorbed into the body?

: Factors involved in determining how RF energy is absorbed into the body such
: as:
: 1. Dielectric Composition
: 2. Size of the body
: 3. Shape and orientation of the body and polarization of the field
: 4. Complexity (near field) of the RF field.

: The human resonance region is from 30MHz to 300MHz

: In instances where the size of the body is less than the wavelength, there is
: little absorption and a uniform or equal, distribution of energy. In this
: range, the body becomes increasingly conductive as frequency is decreased.

: When the wavelength is roughly equal to the size of the body there is the
: highest absorption with unequal distribution of the energy. Consequently,
: "hot spots" may be generated.

: When the wavelength is less than the size of the body there is lower
: absorption and the heating is confined to the irradiated area.

: Specific Absorption Rate (SAR) is the basis of most safety standards. It is
: the rate of energy absorption per unit of body mass. At an absorption level
: of 4 watts/Kg reversible behaviroal disruption has been noted. Levels above
: 5watts/Kg have resulted in permanent adverse effects. Therefore, most
: standards have been based on SAR's of 0.4watts/KG to conservatively limit
: exosures to 1/10th of these levels to account for biological uncertainty and
: to add an additional safety factor.

: The guns used by the police are instant on. The operator has to use the
: trigger on the gun to transmit. The power levels are in the order between 10
: and 100 milliwatts. At frequencies in the tens of GHz. Well above the
: human body SAR.

: Think about all those 25w radio transcievers that have their antenna mounted
: on a body panel with the tip of the antenna at head level. Take a radaition

: field strength meter and survey where the driver sits. This is more of a
: concern that their low power radar guns. The antenna should be mounted on
: the roof for safety as well as good omnidirectional radation pattern.

: I know this is off topic for the scanner group but I am just contributing to
: an on going discussion. I have changed the subject line to reflect this. If
: you have no interest then don't download or read and delete. If anyone has
: any further questions I would happily respond off the group.

TUNE IN ON TELEPHONE CALLS!-the controversial book on "recreational eavesdropping" on cellular, cordless, and other wireless telephones, as well as pagers has just come out in its updated third edition. The 160-page illustrated handbook is filled with frequencies and techniques. It even has a new cover design.

The new edition has the 30 new cordless-phone frequencies, and also shows specific 900-Mhz cordless channels. You can learn about scanner accessories such as descramblers and DTMF tone decoders that display the digits people enter into pushbutton telephones. The book also covers specialized scanner eavesdropping antennas, an accessory to decode digital non-voice pager messages, and more.

According to our mail and media reports, recreational eavesdropping on cellular, cordless, and air/ground phones continues to fascinate scanner owners. The third edition of TUNE IN continues as the primary souce of information on the subject.

TUNE IN ON TELEPHONE CALLS! (Cat. no. TT-3) is available from many leading hobby communications suppliers. It can also be ordered from the publisher for $16.95 plus $5 shipping and handling ($6 to Canada). New York residents must add $1.87 sales tax. The book is published by CRB Research Books, Inc., P.O. Box 56, Commack, NY 11725. MasterCard and Visa orders can phone 1-800-656-0056; in Canada, Alaska, and Hawaii, call 516-543-9169.

{Copied out of a recent issue of Popular Electronics, and posted for the interest of the group, I am NOT the one selling this}

Because I am pretty good at fix'in things, I was given an old Bearcat 300 scanner to have a look at. I had been given no idea what might have been wrong with this critter. When I plugged it in, the display came on and it started to scan, but since there was no antenna attached, it did not pick-up any thing. I took it out to the work bench and opened the case so that I could get direct access to the back side of the antenna connection. I then attached a 'gator clip with a long wire to the center connector of the female antenna plug. I still wasn't getting much anything I am not a very patient person so I started messing with the preprogrammed buttons - "Air, Trans, etc." About this time the display went out. If I put the squelch all the way up I get a the "rush" sound.

This BC-300 scanner looks like it was and could still be a great scanner. I am wondering if it would be worth it to have a professionally repaired.

Any suggestions would be appreciated.

Brian

I've not heard of any scanner restrictions in Washington or California. I don't believe such rules exist in these states. Not that such things might have been proposed. In any case, in metro areas with both states, public safety agencies are moving to 800/900 MHz trunking systems and eventually digital so it becomes sort of a moot issue anyway.

KL>when i'm using it with the AC or car DC it heats up, to a point where is
KL>uncomfortable to hold in hand. It does't burn or anyting it's just hot, i'd
KL>say about 90 degres.

KL> Any info would be appreciated.....

It will heat up a little. Make sure the radio is standing up so the
batteries can radiate their heat. If the radio is charged while "on
its back" it will get much hotter.

Remember to not overcharge the batteries. Once a battery is fully charged
it will get very hot if continued charging. This will ruin the battery
eventually. Continuous overcharging can cause dendrites, which short the
cells.

The best solution is to have a second set of batteries and charge the
batteries in a cheap "slow" to "medium" charger (7 to 3 hours). You can
buy a GE/Sanyo 7 hour charger for $10 with 2 AA nicads.

Hi all,

I want to buy a scanner but I can't make my choice between these 3 models :

- AR AR1500 (0,5-1300 MHz)
- AR SS2000 (0,5-1300 MHz)
- Uniden UBC-220XLT (66-88 MHz
118-136 MHz
136-174 MHz
406-512 MHz
806-956 MHz)

I live in Switzerland and I don't know if the range of frequencies of the Uniden is large enough.

Thanks for any information you can send me.

Nick

Does anyone in the industry know if scanners with the ability to follow computer signals from trunking radio systems will ever be available? Down here in Broward County Florida it's no longer fun to try to listen to the scanner because there are at least 25 frequencies and it is impossible to monitor local areas there is so much traffic.

4764. Scanner that covers 0-5 MHZ and 950-1450MHz?

4767. Coax & antenna questions

Newsgroup: rec.radio.scanner
Date: 1996-03-02 00:00:00 UTC
From: Brian.Petersen@604.sasbbs.com
Message-ID: <583_9603022129@sasbbs.com>
Source record: 238925

I have a few questions regarding which type of coaxial cable I should use for my scanner. I have a PRO-2006 base scanner and am planning to buy an external roof antenna - will talk about that later. For now, I'm confused as to which type of coaxial cable I should get. I'll be running anywhere from 50 to 75 feet of coaxial cable as my "radio room" is on the first story of our second story house and I plan to put the antenna on the second.

Anyway, regarding the coaxial cable, I have heard that it is best to aquire coax of a certain Ohms value. Which ohms value should this be? I've heard both 50 and 52 are "the best", but obviously there cannot be two bests! :) Second, what exactly does the ohms value have to do with my scanner? What/ how does the ohms value affect the radio signal(s)? And finally my primary concern is in which type of coax I will buy. Since I will have a fairly long run, I want to buy the coax with the least dB loss per x number of feet. I have heard a lot of bragging about the Belden 9913 coax cable which appears to be 50 ohm coax with a 10.6 dB loss on frequencies at 1 GHz per 100 feet. Yet, the Belden 9914 coax only has a loss of 6.0 dB on frequencies at 1 GHz per 100 feet. However, 9914 is 75 ohm coax, which leads me back to my first question about why Ohms matter?

As for the antenna, I have been told that the iCOM AH-7000 and Diamond D-130J antennas are good discones. What do you guys think? What is the best discone for scanners in all of your opinions? My listening will range from 28 MHz to 896 MHz <grin>.

Please reply to: brian.petersen@604.sasbbs.com

Thank you!

<snip>
>Thanks
>Jim Olson

I think it is just a piece of small guage wire wrapped around
something usually tuned to 150Mhz. I didn't want to sacrifice mine for
the cause. BUT,

I have access to a 1Ghz 30dB cable TV amp and sweep gear and have done
a return loss test on 4 duckies with very interesting results.
All of the duckies I tested were tuned narrowly to the 150 Mhz area
(except a HAM radio duckie was best in the 144Mhz area). The scanner
duckies were clearly set up for the 150Mhz business band area and did
a very good job. They were also resonant at 300, 450, 600, 850Mhz and
showed just OK results there. The rest was pretty bad.
I was able to test one of those telescopic types. It really wasn't
that good. I could see it change its resonant frequency when I pulled
out the antenna at different lenghts. It was really difficult to tell
sometimes where the resonant area was unless I did see it move. I
don't think I would buy one.

Next I am going to try a freinds magnet mount antenna which has two
loads in it and see how it reacts. Should be interesting.

I hope my boss isn't reading this.

Call Bearcat, they are located in Indiana, you can send a one time standard fee (Don't remember what it is), and send the scanner, and they will fix anything that is wrong with it.

Hey Jon I have a Bearcat 210xl. It is in fine working order. I would
like to upgrade it to one that gets the 800 MHZ. What is it worth?
E-mail me at floridad@ix.netcom.com.

4777. Where to find Frequencies

Just a reminder to those needing scanner frequencies for certain areas.....there is an interesting web page with a search engine at http://www.ultranet.com/~bellvill/scanner.html

Do you know of any other search engines?

Try tracking down the Xerox mapping system - will draw you such a map
with lots of options on line.

I've not got the URL to hand, but I'm sure that any of the WWW search
engines will find it - it's widely used on the 'quake newsgroups for
plotting quake locations.

>you can and can't listen to????

Here in Sweden where I live It's leagal to listen to everything transmitted in air. But you must not repeat it or use it to commit crimes related to the specific matter you overheard.

I listened to celleluar for years and have always been bored with how dull people are. Cant imagine why such a high percetage af the posts in newsgroups like this is about unblocking the cell range. Guess that it makes it more intressting knowing it's eleagal.

Sorry for bad spelling.

4782. FS Scan*Star SE for Windows $70

Newsgroup: rec.radio.scanner
Date: 1996-03-03 00:00:00 UTC
From: dayglo@radix.net
Message-ID: <4hdbef$t33@news1.radix.net>
Source record: 238800
Cross-posted to: rec.radio.scanner,rec.radio.swap

I have Scan*Star SE for Windows v5.73 (latest Version) forsale.

It can be used with the following radios:

AR3000
AR3000A
AR8000
Drake R8
Drake R8A
Icom R7000
Icom R7100
Icom R9000
Japan Radio NRD535
Optoelectronics 456/535 which basically means the Pro 2005/6 and the PRO 2035
Yaesu FRG9600

It has never been installed and the waranty card has never been filled out/sent in.

First $70 get it.

Source record: 238801

re: PRO2006 tech. info...

These scanners use 2 seperate PLL synthesizer chips.
One is the Motorola MC145158 and the other is a CX7925B, I'm not
sure of the manufacturer of the latter. These are both serially
programmed from the microprocessor by common CLOCK and DATA lines
plus an ENABLE line for each chip.
I don't have any data for the CX7925 but there is plenty of info
on the MC145158 in the Motorola Communications Devices databook.
The reference clock for the '158 is 10 MHz. The reference gets
internally divided depending on the data word that has been sent to
it from the micro to setup the step size. By connecting a frequency
counter to the REF OUT pin (pin 14) you can check the actual reference
frequency. By probing around the VCO's with your freq. counter, you
can determine whats going on and come up with some calculations. Keep
in mind that the'158 has a prescalar connected to it.
This is the "harder" way to do it. The simpler way would be to study
the microprocessor source code and see how it is set up to talk to
the PLL chips. (If you get a copy of the source, let me know !! :)

Regards!

Try this first.... ftp://ftp.demon.co.uk/pub/ham/scanners/pd-200.zip

This lets you hook the audio-out of your radio to a small hardware circuit,
to your PC, and decode the stuff.

Or, if you want to build one fron scratch, go to the Philips www site,
http://www.semiconductors.philips.com/ps/philips5.html

and search for the PDF files relating to pagers. There are a couple of
reciever and decoder chips there to play with.

Hey whoa....
I'm not the one who posted the drivel about speed kills, I speed all the
time. Just got back from a 85 MPH shoot down to Ashland. Speed doesn't
kill, if it did there'd be a lot more deaths.

You can either decode the 10kHz Manchester data burst from the tower
that tells the mobile where to go, or you can modify a Motorola car
phone to hook to your PC and use 'Celltracker' or 'Spytracker', or
there is a command in test mode on the motorola that tells you where
the call went (in HEX) and then you can punch the new channel through
the keypad on the phone.(No PC needed).
try....

From: dwentz@basenet.net
Message-ID: <4hbhpq$4cm@news.accessus.net>
Source record: 238807

I just purchased a Radio Shack Pro 2036 scanner. I believe this is is the same radio as a Bearcat BC 890XLT. I purchased the radio to monitor some of the local HAM repeaters in the area, but am having problems with some of the 220 Mhz frequencies. Once I get the radio in the 220 Mhz band it will only allow me to make steps of 12.5 or 25 Mhz. The 5 Mhz step is no longer available. Even if I Manually enter the frequency it will round it up to the closest 12.5 Mhz. Does anyone know of a MOD for this?

I would also be interested in any other MODs for this scanner., or Information on where to connect a S Meter.

Thanks for your help in advanced.

That about wraps it up. I know what you're wife means about the
lack of hygien by many fleamarket attendees. Like they are too eager
to get to the fest so they don't miss out on the 'good deals' to
take the extra 15 minutes to grab a shower before heading out.
By the same token I've come across some pretty slimey CB ops..I'd
bet if you get a cross section of them together in one room (like
a Ham fleamarket) you could expect similar observations.

Many Hams are funny, there are plenty of obsessive-compulsives in the
bunch, thats for sure !

So, whats your callsign ?

4796. Re: Why *radio* telephone?

Newsgroup: rec.radio.scanner
Date: 1996-03-03 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <4hcp1r$imn@hopper.acm.org>
Source record: 238933

The UHF mobile telephones preceeded cellular by many years. While most
systems are being phased out (with the channels being used for paging),
some users remain. They've long since paid for the equipment and coverage
may extend to areas not yet served by cellular.
The UHF airborne telephones are used in private & general aviation craft.
They are also older than the 800 MHz AirPhone systems found on airliners and
significantly simpler to install and operate.
For reference:

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Mobile Telephone [22.501]

VHF - 30 kHz spacing
Base: 152.030 - 152.210 RCC
152.510 - 152.810 telco
Mobile: 157.770 - 158.070 telco
158.490 - 158.670 RCC

UHF - 25 kHz spacing
Base: 454.025 - 454.350 RCC
454.375 - 454.650 telco
Mobile: 459.025 - 459.350 RCC
459.375 - 459.650 telco

Many of these channels may now be used for paging,
specifically 152.78, which is a nationwide page.

Air to Ground Telephone [22.521]

Ch Ground Airborne
Signaling 454.675 (459.675)
6 454.700 459.700
7 454.725 459.725
5 454.750 459.750
8 454.775 459.775
4 454.800 459.800
9 454.825 459.825
3 454.850 459.850
10 454.875 459.875
2 454.900 459.900
11 454.925 459.925
1 454.950 459.950
12 454.975 459.975

Transmissions are FM. Ground stations repeat the airborne half of the conversation, and transmit a continuous tone when idle. From one to four channels are assigned in a particular area.
Service is used on private aircraft.

I have a 850 XLT that I had to 'snap' the power supply once and awhile to get it to reset and now the scanner is realy whacko'd out. I think the chip is o.k. but I don't know about the rest of the components. If anyone could give me some tips and other ideas that would be great. The keys have no affect and the display is mostly junk but it still 'blips' at the scan interveals. I live in St. Louis so if anyone knows any local repair shops that would be great (cheap please!). I don't know if this e-mail address works so just post here thanx

First of all, get as many channels as you can afford. There is not a lot above 900 mhz, but some of these do get cellular images up around 1100 mhz. About the only other ones that are worth considering are either AOR (budget permitting) or Bearcat. The one big advantage R/S has over these is repair, since you only have to take it to any store to send it off to be fixed.

If I were you I'd look quite closely at the AOR 8000, which has all the bells and whistles you could ever want. AOR also has some not as widely advertised units that are neat too. For more info, see Popular Communications or Monitoring Times magazines. These are great resources too.

4801. Expensive(!!) Antenna Splitter from Radio Shack???

Newsgroup: rec.radio.scanner
Date: 1996-03-03 00:00:00 UTC
From: Jason Piush <snp346@freenet.mb.ca>
Message-ID: <Pine.SOL.3.91.960303123201.26756B-100000@winnie.freenet.mb.ca>
Source record: 238938
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi again all,

I have been trying to set up my PRO-51 to work in my vehicle, but I am running into an antenna problem. A solution I have been considering is using my existing AM/FM antenna as a dual scanner/am-fm antenna. (I know there is a whole other issue with the am-fm antenna not being as good as other antennnas out there...I'm really just looking for a simple solution to my simple problem.)

Anyways, I was in Radio Shack a couple of days ago and I spotted a splitter DESIGNED to split the AM/FM antenna with the scanner. The sales person I spoke to said that this splitter was designed with a transformer built in so that there wouldn't be a problem with impedience mis-matches between the scanner, the stereo, and the antenna. (I was under the impression that impedience only mattered when you were TRANSMITTING not recieving only - as a scanner does)

So should I go running back to my Radio Shack and drop the $40 that it will cost me for the splitter, or should I just go running the other way?

If I go running the other way, what are some solutions to my problem? Is it possible to make my own splitter with a transformer, or should I just not worry about impedience mis-matches and just purchase a simple Y splitter for my antenna?

Any suggestions would be appreciated.

Jason

all outside mounted antenna's should be properly grounded
for protection from lightning strikes.
you might also want to get into the habit of disconnecting
your equipment from your feedline when not in use.

for more detailed information, checkout the arrl books,
the arrl handbook for radio amateurs or the arrl antenna handbook.
you can find ads for these books and more in amateur radio magazines
or popular communications.

>>>Does anyone know if Radio Shack's HI-CAPACITY rechargeables are any better than standard nickel-cadmiums? I get about 6-8 hours of use per charge on my handheld scanners with standard Radio Shack rechargeables.<<<

They seem to last longer, but I havent compared the two very carefully. On a recent trip to RS, a salesman friend talked me into buying them. He also said that even if you don't get much MORE use out of them (minutes), they can be recharged and drained more times than a standard rechargeable battery, so I guess it pays off either way.

That's exactly what the question was: Can I use a TV antenna to get better
reception. YES! You could have a loss of 20 db (in a perfect environment)
but many high gain TV antenna's make up for it by adding 25 to 30db gain.

I'm not being ignorent, but the only scanner that could be the brother
of the 2006 nolonger exist. it was the Pr0-37 handheld.
this handheld used the same cpu as the 2006, but could only access
1/2 of the cpu. any other mods that could be done on the 2006 in
theory could also be done on the Pr0-37.

Dammit, it can be either a ham rig OR a scanner. Amateur licenses exempt
you from the majority of FCC laws. If you were a ham,
you'd know this! If you are a ham, my sincerest
apologies... (NOT!) By the way, GNN sux.

Yep, all those experts are wrong. Anyway, here is the reality: Just buy
all the insurance you can, so when you hit somebody doing a "safe 80 MPH",
you can help pay for the big-time medical expenses, rehab expenses,
funeral bills, and attorneys fees. Then maybe you'll only have to give up
half of your wages for the rest of your life, plus any assets you may own,
for the pain and suffering award and punitive damages, when the real
victim sues your butt off. It doesn't matter if you believe that 80 MPH
is safe or not. You still lose.

>

One of the ways to do this is to buy a recorder with dual wells and relay record and a timer switch. I know of only one, the Kenwood 6070. The recorder can then be hooked to a radio or receiver and the receiver and cassette combo to a timer.

This will allow you to record one 4 hour show (on both sides of two C120 cassettes). Or if the programs you wish to record are on the same station you can record say two 2 hour shows.

The hard thing may be to find a suitable timer. I have a nice Radio Shack timer which has been discontinued.

Then again the hardest thing may be to find time to listen to several 3 hour shows. Or even more to the point,if these are talk shows, how do you plan to remain sane??

BM>story (above) got posted to the relevant ham/scanner/whatever
BM>newsgroups with a plea to send the station e-mail demanding a more
BM>accurate portrayal of the issue (and the REAL culprit- shoddy
BM>consumer appliances) along with an apology to the ham. Anyone
BM>interesting in making this project "happen"?

There are usually two sides to a story and it seems like without all the facts starting a flame war with KING-TV is pointless. If my neighbors experienced TVI they wouldn't go running to the media. Did the guy make any attempt to help his neighbors out of their problem or did he tell them to go fly a kite, it was not his problem? Is there a rectification problem in a poorly bonded downspout or even a poor ground at his station?

Somebody who lives in Magnolia should ascertain the facts and report them before outsiders take any action at all. After all, part of the problem may well lie with junk telephones they bought for $5.00 on special which they have other problems with.

Seems like everyone is looking for someone to hate these days.

>phone could be used in your house as a portable cordless phone.

I used to work and manage a few of the stores a couple years ago, and this argument goes both ways. If you walk into a Radio Shack and depend on a Shack employee for your information, youre an idiot. Just like at many other retail chains, Shack employees are salespeople with one thing in mind: to sell. They are not there to educate you, and many times they dont know the product.

RS employees are not specialists, especially around the holidays. We used to hire high school kids to come in and help for Xmas, etc. Do you honestly expect a new employee to intimately know much of anything about the completely diverse product line at the Shack? RS sells mostly stereos, computers, VCRs, and small parts as the breadwinners for the salespeople. With the near minimum wage and slim commision rate they offer, theres not much incentive for the employees to do much extraciricular work. Thats why its so hard to run a good store (as I found out).

A good store has a mix of good salespeople to close big sales, and a handful of specialists who can be called upon to get in depth with the products. If the person youre dealing with isnt capable of helping you, ask for someone else!

See ya, Joe

RS recently dumbed down their commission pay scales so you make even less.
But hey, what do you expect, it's retail. You are not going to encounter
either the most capable or the most avid radio hobbyists working there. You
can find some good folks there that know their stuff, but that is usually the
case at some small franchise store in BFE. I can't see how this surprises
anyone, but I'm sure old Charles Tandy is spinning in his grave. Welcome to
the service economy, dude.

I have a Pro 39 that had several keys that wouldn't work.
I first took it to Radio Shack (mistake) to see if it could
be fixed. They charged me $20 to tell that I need a new
board for $120. I posted a message similar to yours and got a
reply saying that I only needed to replace the keypad.
I went to my local Radio Shack (hated to do it) and ordered
the part for $5.00. My Pro-39 is as good as new!
Sorry I don't know the part # for your model but someone
else may have it. I think your problem is that there is a
metal paste on the back of the buttons that have worn out.

Did you just do the cellular mod? Did all the keys work OK before
doing the mod? If yes to both, make sure you observed proper polarity on
the diode you worked on...

Joe Kearney wrote:
>
> I too work in a Radio Shack but it seems that my experiences have been far different than those I've read about on this group. Perhaps that's due to the fact that I live in Canada. Here we
get at least $7/hr for minimum wage. However, I wouldn't be caught dead working for that pitiful
amount. The truth is that with some good, old-fashioned hunger I average $10+ even in the off-season (ie. Jan-Nov) :) Our company loves the young, part-timers going to colleges and universities 'cause they'll know that we'll hustle our asses off to pay these student loans. So
far I have received a great deal of product and sales training with both role-playing and reading
supplements. The sad truth in retail is that you will have high employee turnover so it sometimes is difficult to return to the same store and find the person who originally helped you.
However, despite stiff competition in areas such as computers and personal electronics, we have
found our niche here. Our store sells at least 2 scanners and/or cbs per week. Nobody can match
us nationally for these kind of products. Also, our expansion into repair work means customers
no longer have to throw away electronic goods that have stopped working. I'm sorry if this sounds like an ad but I must say I do enjoy working for this company, at least for now. As to
our knowledge, if I'm giving the choice of answering questions about an 0.89$ pack of resistors
or a $300.00 scanner, which do you think I'll "know" more about? I'll always remember the ad for
a law firm headhunting for JPs, in part it read, "Eat what you kill." Words to live by indeed.

Hi,

Does anyone have any freqs for Key West, Florida?
Will be visiting there soon. Interested in the civilian
freqs, but especially the Key West Naval Air Station
(NAS) frequencies.

Does anyone have any pointers on where to find this
info? Would like to know where to find military base /
air freqs in general, if someone knows. If posting here,
please email as well, as my server kicks news through
rather quickly. Thanks!

John.

Hi,

excellent article in one of the road & track type mags recently
dealing w/ this very topic (jammers). Yes, any that transmit
are illegal per the FCC (and also really expensive, if you want
one that might work). They also tested this "passive" crap, and
they did absolutely nothing. What a waste of bucks! Sucker born
every minute.

Try pressing the RESET button on the front panel while scanning in this area.
This should restore the default step size (30kHz) for this mode, and the
display will indicate 30kHz too!

11A3 should be easily modifiable. Since the Pro-2026 is a dual-conversion receiver, it is susceptable to overload and images more so than a triple conversion receiver. However, you simply cannot beat it for the money!

I run one mobile and one base, and have had very few problems and very good results. I also have other scanners to compare it to, and find it totally usable in my situation. I might think twice if I was in downtown Ney York City, however.

I ordered a copy from Howard via Compuserve (see above) a couple of months
ago, and all told it cost me $18.45 I think. It is still available directly
from Howard, but is out of print with only a limited number of copies left.
That is why no dealers have them.

> Dammit, it can be either a ham rig OR a scanner.
> Amateur licenses exempt you from the majority of FCC laws.

Let's see ....

The FCC does not enact laws.
An amateur license does not exempt one from any Federal laws, nor from
any FCC Rules or Regulations. In fact, it obligates the licensee to follow
an additional set of regulations i.e. 47 CFR 97.
The FCC declaratory ruling (PR Docket No. 91-36; FCC 93-410) preempting
certain local laws is specifically limited to amateur transceivers and does
not apply to scanners.

.... other than that, you hit the nail on the head <g>.
/* barry /&

(P.S. All current _state_ laws contain exemptions for hams that can
be interpreted to allow the use of scanners as well as transceivers.)

I believe it's actually worse than this...the letter of the law states that you're not meant to
listen to anything that's not meant for you. So even Air (Civil and Military) is out.

This just leaves us with broadcasts - ie Commercial Broadcasters, CB and Ham.

I have an Icom R-100 that I'd like to sell or trade. This is a pre block unit, (no cellular block). I need a handheld. Interested? Please e-mail me at richard@frugal.com. This is the best way to reply, I check messages throughout the day.

I'd say there is a very strong message here! If in fact it happened as you say, the Communications Electronics must not be interested in doing any future business with you, me, or most anyone else that has read your message.

This is becomming a common problem today. That's why it's sometimes best to stick with the established firms, even if it means paying just a little more up front.

Bill

4847. Re: PRO-2035 RX sensitivity?

Newsgroup: rec.radio.scanner
Date: 1996-03-05 00:00:00 UTC

Kwon2m (kwon2m@aol.com) wrote:
: Has anyone done sensitivity measurements on a Radio Shack PRO-2035? I own
: one of these units and have found it, in comparison to other scanners I
: own (PRO-43, BC300, BC210XLT, and others) to be pretty deaf on VHF-HI (144 -
: 175mhz). This prompted me to do some sensitivity measurements. Using an
: IFR1600CSA service monitor ($35000 price tag, recently cal'd), I found
: that the 2035 measured around .2 - .25uv for 12db SINAD over most of its
: frequency ranges (up to 1000mhz). This is excellent performance and
: exactly what I would expect from a receiver of this caliber (and price). On
: VHF-HI, : however, I measured only about .6 - .7uv for 12db SINAD. This
: is, in my opinion, TERRIBLE performance! I haven't seen a monitor
: receiver since the old "tunable" days that had sensitivity this poor.

Actually, .6-.7 is pretty good sensititvity. Most commercial receivers are generally in the .4-.5 range. I've found most scanners I've reviewed to have an average VHF sensitivity of .7 (some as high as 1uV, other as low as .4 uV). My 2-meter repeater uses a 20-year-old GE MASTR-II receiver, which was designed to have .5 uV sensitivity; I currently get .7 uV at 12dB SINAD, which is pretty darn good for a radio that spent 20 years bonking around in the trunk of a car!

: For comparison, I also : checked my PRO-43 - .15uv over most of its ranges,
: and BC300 - .2uv on VHF-LO and : HI, .35 on UHF. I took the 2035 back to
: Radio Shack for warranty service ("You have questions, but we don't
: understand them"). They sent my rig out, but : it came back "no problem
: found". I repeated my tests, with the same results.
: Scanner specs have always been very conservative and the 2035's are no
: exception. This pretty much gives RS an out, as the machine meets their
: specs. It doesn't leave me a happy customer, however. I guess the bottom
: line is this - should I expect more from my 2035, or is this sensitivity
: typical on VHF-HI? Any comments would be much appreciated. Please email to
: KWON2M@AOL.COM. Thanks.

You might latch on the the service manual and try retuning your '2035, paying particular attention to the VHF alignment. I'd guess that you'll find a great improvement. Tuneup in the factory is probably a fairly hurried procedure, just enough to get it down to spec and no better. Don't take it too far, though, or you might get a lot of trouble with interference and intermod you didn't have before.

BTW, my '2035 works great.

4848. Cheek Fore! Cheek 4?

Newsgroup: rec.radio.scanner
Date: 1996-03-05 00:00:00 UTC
From: an519923@anon.penet.fi
Message-ID: <101415Z05031996@anon.penet.fi>
Source record: 238857

Here ye here ye. Watch this space for the really big big new and improved Cheek. Including
such items as:

Virtual Downconverting, I invented it, I was about to patent it and those guys at Cellular
Security started using it without my permission. I'm so mad I could flame.

How I made Fido net safe and usable when Stormy took a powder. Yes, I saved the day again!

With an introduction by Ken Storm who in addition to thanking me for taking the helm when he
jumped into the sea has also credited me with the design concepts found in most modern
scanners manufactured since the 1986-87 PRO-2004.

With a lengthy explanation of just why I get along so well with everyone. My former partners
have made up with me and now acknowledge that they were jerks and I really was a nice guy
after all. The new upcoming updated computer interface for the GRE manufactured scanners is
now announced. Not only that but I am such a nice guy that I will give away the schmatics.

And last but not least - all the folks who order this new Cheeky creation before it is published
will get a copy of the companion book - The Moss letters. This is a collection of the best of my
missives and missiles to and from Andy Moss. These are culled from the best of our Fido, E-Mail
and Usenet posts. Along with this I will also include my just pressed CD including every item I
have ever sent or received from my pal Andy. This will show the real Cheek and the real Moss.
There is nothing growing on these stones and when you see that the whole mess was just in
good fun (see E-Mail Chapter 3 , message 16) you will be in on our inside joke. WE REALLY
LOVE EACH OTHER!!

So watch this group and see just how Cheeky things will get with the new and improved Cheek
4!!!!!!!

Sorrrrrrrrry folks. No mods this time. The next mod book will be Cheek 5
or Cheek 6.

Search 450 to 452. You might find some freqs that are not posted/listed. In St. Louis when units get out of repeater range they have a simplex freq to go to so they can talk car-to-car, these aren't always posted. You might some itinerant sports/news crews on there too. The big thing here in town is for the news crews to be sent messages on pagers, because of scanning by the competition. Keeps cell phones down.Gotta get POCSAG.

Also all the news live trucks use a XMTR (170 to 200mhz) for director cue(IFB). This is usually Van cell phone fed into XMTR to go to the reporters ear. Goota be close its only 100mw.

47.42 MHz is the Nationwide Coordination Channel. It is a Special Emergency frequency. This is the only exclusive American Red Cross frequency. Most chapters are assigned a secondary freq in the 47-48 MHz range. Beyond that, many chapters have local arrangements, perhaps UHF or amateur emergency back-up. There are also countless arrangements and agreements for interconnectivity with allied agencies at the local, state and national levels.

Check with your chapter communications chairman for local information.

+> know powerup modes (i.e, Button-A,Button-B,Button-C on poweron, etc).

I don't think there are any special key sequences that'll work to get you
into the Cellular area, but I just found out where you can buy a brand
new, in the box Pro-26 that'll get full cellular coverage!

A couple months ago, I bought my Pro-2006 (brand new, in the box with full
cellular mod already done) from Durham Radio Sales & Service in Canada
<http://osha.igs.net/~durhamradio>. They also sell the Pro-43 that's
cellular ready as well as some other cellular ready scanners.

Well I called to order a Pro-43 so I can listen in the car and I spoke
with a guy there named Keith. He said they are going to start selling
PRO-26's with full cell coverage.

He says they're not some tricked out stateside Rat Shack models but the
ones with the european chip in them. They get cellular right out of the
box, without any mods at all and they come with a guarantee to boot!

So, I'm gonna get the Pro-26 instead! I'm psyched! Now we're gonna be scanning!

Oh yeah, the phone number for Durham Radio is (905)436-2100. Ya might want
to ask for Keith.

John

4859. FS: Radio Shack Pro-2026, 2 mos. old, modded

Newsgroup: rec.radio.scanner
Date: 1996-03-06 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <4hk2js$bd5@cville-srv.wam.umd.edu>
Source record: 238744
Cross-posted to: rec.radio.swap,rec.radio.scanner,dc.forsale.misc,misc.forsale.non-computer

For sale:

Radio Shack Pro-2026 Mobile scanner. About 6x6x2 inches, weighing about 2 lbs. Amber display, direct entry of freq., auto-search of weather, air, fire, police bands. One set of programmed limits and 100 memories in 5 banks of 20.

Purchased 12/29/95 (not by me), and I have the receipt. The unit has been modified for 800 MHz receive. Perfect condition, with all accessories (mobile bracket), manual, power cable, receipt, and box.

Asking $195, will ship anywhere in US via UPS. Offers considered.

Reason for selling:

Found a BC-8500XLT (non-modifiable) with more features, and I don't really care to listen to the cell stuff anyway. Please call or e-mail if interested. Thanks!

Hello all-
I am taking a trip this weekend, from Indianapolis to Newark, New Jersey. It would be greatly appreciated if someone could email me the frequencies for

1. Indianapolis Airport tower and Continental Airlines frequencies.

2. Newark Airport tower and Continental Airlines frequencies.

3. Anything else of interest for this trip.

My email address is cgafah@indiana.edu. Your generosity is appreciated.

Craig

4864. Freqs for Chicago, IL

Newsgroup: rec.radio.scanner
Date: 1996-03-06 00:00:00 UTC
From: lui@netcom.com
Message-ID: <lui-0403961726010001@192.0.2.1>
Source record: 238865

I'm taking a trip to Chicago this weekend (and to Columbus, IN, the following week) and wanted some interesting frequencies to listen to while I'm there. I don't need an exhaustive list though. I'm sure Chicago has hundreds of active frequencies, normal for a city of that size.

Stephen

JB>---
JB>Regards,
JB>Joe email: brady@hptstdev.lf.hp.com

The AR8K has a very simple voltage regulator to charge the batteries. It
is a "linear" circuit, and thus will drop the difference of the battery
voltage and the wall wart voltage across a pass device.

I suggest charging with a cheap external charger to keep the heat
away from the radio.

From: milliron@ix.netcom.com
Message-ID: <4hivvn$43c@reader2.ix.netcom.com>
Source record: 238871

I am interested to know if anyone out there lives near the rather large radio tower near the intersection of Lee Highway and Gallows Road in Merrifield/Vienna, VA. I am within 2000 feet of it and I believe it is causing quite a lot of interference on my PRO-62 and (brand new!) AR8000. I seem to be picking up commercial FM "echos" anywhere from 80.0 mhz to 120 mhz!

I believe 105.9 and 106.7 FM transmit from this tower. Does anything else?

Will a notch filter like the one sold by Optoelectonics for the FM band make much of a difference?

Thanks in advance

These might get you cordless phones in Australia or somewhere else, but in
the U.S. you'd better be looking in the 46.610 - 46.970 area.

Use the most expensive "sale-item' that you can find. (The monthly "sales-items" are usually out front, as opposed to being behind the counter.)

Handheld scanners and ham radios are particularily good for this type of thing.

The PRO-34 was my first handheld scanner. Bought it new in August, 1989,
and it's still going strong. A little slow by today's standards, but it
gets the job done.

>1. How much is this thing worth?

Assuming it's in good shape, $100-150, and probably closer to $125

> 2. Is it restorable? The model number is worn, but it looks like it
> ends with 20-135.

Yes. ALL PRO-34's are restorable. It involves a little bit of work...
you have to desolder the antenna connector, disassemble the scanner, and
cut the diode, but it most certainly is capable of full 800Mhz reception.

I have one dated 1A6 and it ALMOST works. It will store all the test
frequencies except the one 23 which is 888.96MHz. It does, howver, give
me 66.450, 76.825, and 87.425MHz which are not normally available on the
scanner.

Its been a couple of years since I visited Tysons Corners, but there used
to be a large b'cast tower near there (near the subway train station)
which was the PBS tv station tower (I forget the call sign). But that was
a UHF station....

Yup, I also went and lookef for the top ten list and it's over in the
NHSTA stats page. Unless you have a Adobe .pdf reader you can't read it,
but, if you can you will see that the stat: Speed Too Fast
is not in the top ten. Failure to yield right of way is #1 followed by
unsafe following distance. Note this is for accidents not fatalaties and
they don't factor in Alcohol, so you won't see DUII on the list. In other
reports they do not list "speed too fast" rather they list the "Speed
Related" category. If you read the footnotes you'll see what "speed
related" is. Includes=High Speed Chase, Following too close, unsafe lane
change, speed to fast for *conditions*, speed to SLOW, etc. Speeding is
not one of the "Speed Related"

What sort of mods are you looking for? Tandy did a couple of
books on Scanners, one of which I recall had mods in it.

PS please turn CAPS OFF, its considered as shouting on here! :-)

4889. Regency R806 Scan speed

Newsgroup: rec.radio.scanner
Date: 1996-03-07 00:00:00 UTC
From: ggcomm@iinc.com
Message-ID: <4hlmn3$c5i@xcalibur.iinc.com>
Source record: 238749

Here's a simple and effective modification to increase the scan speed for the Regency R-806 crystal
scanner.

The processor is driven by a 4.000 mhz crystal that is located at the edge of the pc board, next to the
process I.C. It is marked X102.

By replacing X102 with a 6.400 mhz crystal, the scan speed increases significantly. Our crude method
of figuring scan speed yielded 12.8 channels per second before modification and 21.4 channels per
second after this mod was done.

Ok then Mr. X Radio Shaft manager.... Just who is the idiot(s) that spend the big bux on those "We've got the answers" commercials????

There is no reason NOT to expect answers and I mean correct ones, we customers are asked to drop $100 plus on their products... While it may be unreasonable to ask the sales dude how to build a scanner, it is not to much to expect that he/she/droid could discuss band width, freq ranges, etc....

Robert,
The BC3000xlt cannot be moded to receive Cell in the normal 850-900Mhz
range...It is covered under ECPA and cannot be "unlocked". The mod
U saw is for a downconverter that takes Cell Harmonics and
Drops them in the 300Mhz range...It's basically a waste of $$$ because
the 3000 picks up cell harmonics in the 1005-1030Mhz range!!
Drop Me a line if U need more info :^)
